THE cost of construction of the new Central Essex Railway which will join the Great Eastern Railway at Ongar will be 200,000*l.* The work of construction is to be commenced immediately after the close of the General Election.

THE roads and works committee of the Portsmouth Town Council at their meeting on Monday had an unusually large number of plans under consideration, including those for the erection of forty-four residences. This total is larger than any for a considerable time past.

ACCORDING to *The Board of Trade Journal* tenders will be received until February 9 at the State Tobacco Department, 4 Plaza del Rey, Madrid, for the construction of a tobacco factory at Valencia at the upset price of about 43,597*l.*, in accordance with plans and conditions which may be inspected at the above-named office and at the district office of the Ministry of Finance, Valencia. A deposit of about 2,179*l.* is required to qualify any tender.

THE Edinburgh Dean of Guild Court have granted a warrant for the erection of a chocolate factory on the Portobello Road. The building is to be of red pressed fire-brick, and will be of four floors. The length will be 164 feet and the width 55 feet. The ground floor will be fireproof, and the roof will be covered with asphalte. There will be a central staircase of concrete and two fire-escape stairs. The factory will provide all its own gas and electric light, and for that purpose a one-storey building will be erected.

ACCORDING to American census returns, out of 303 occupations in which men are engaged, women are found in 300. There are 193 lady blacksmiths and eight steam boilermakers; several roofers and slaters; 126 plumbers; 409 electricians; 1,041 lady architects; 167 female stonemasons and bricklayers, and 545 lady carpenters. Of plasterers there are 45; 1,759 house painters and 241 paperhangers. There are also women marble-workers, cabinet-makers, and makers of grates, furnaces and heating apparatus. There are a round hundred lady lumber "men," 989 women quarry "men," and 904 women teamsters and dray "men" for haulage. There are at least 84 female civil engineers.

ELECTRIC NOTES.

THE electricity committee of the Dundee Corporation have adopted a scheme of electricity extension estimated by Mr. H. Richardson, the electrical engineer, to cost 75,000*l.* It is proposed to erect a new power station with two sub-stations on the high-pressure system.

THE Craigpark Electric Cable Company, Ltd., Glasgow, have intimated that, on account of the continued increase in the price of raw materials, they have advanced the price of wires and cables by 10 per cent. This advance applies also to special quotations.

"THE Practical Electrician's Pocket-Book and Diary" (London: S. Rentell & Co., Ltd.) answers its description.

Digitized by Google

Although it would fit in a very small pocket, its pages are crammed with practical information. The ninth issue is a worthy descendant of its eight predecessors.

THE Board of Trade some time ago issued a regulation prohibiting the use of top-covered cars on tramway systems of a gauge as narrow as that in Birmingham. It was feared that the cars would be top-heavy, and liable to be overturned by the force of the wind. A deputation from the Tramway Managers' Association waited upon the Board of Trade in reference to the matter. The Board of Trade has given way. The Birmingham tramway committee have received permission for top-covered cars to be used in Birmingham on condition that the cars are withdrawn when the wind is so strong that there is reason to fear any danger of the cars being overturned.

AN extraordinary general meeting of the Westminster Electric Supply Corporation was held on Monday in accordance with a circular stating that it would be advisable for a group of the West End companies, comprising the Kensington and Knightsbridge Electric Lighting Company, the Notting Hill, the St. James's and the Westminster, to combine in promoting a Bill in the next session of Parliament, under the title of the West London Electric Undertakers' Association Bill, to enable them to free themselves from the restrictions now existing. The proposal was adopted.

THE trial was concluded in Scotland last week before Lord Salvesen and a jury of an action by a stationer of Wishaw against the Lanarkshire Tramways Company, Motherwell, for 75*l.* damages for personal injuries received while travelling on one of the defenders' cars, through the trolley-pole, as the car emerged from under a bridge near Wishaw, leaving the wires and striking him violently on the head. He maintained that the conductor should have guided the trolley-pole while the car was passing under the bridge. The defenders said the accident was the result of a pure misadventure, which no care on their part could have averted. The jury returned with a unanimous verdict for the pursuer. They assessed the damages at 500*l.*

AT a special meeting of the Cardiff electrical committee the question of the conversion of the flat-flamed lamps to the incandescent lights was considered. Some time ago a ication was received from the Cardiff Cas Company as to the terms upon which they would undertake this conversion. The present price paid for the ordinary 16 candle-power lamp is £3 3*s.* 10*d.* per annum, and the charge to be made for the 70 candle-power incandescent lamp is 3*l.* 9*s.* 2*d.*, the Corporation undertaking the maintenance of the lamps, which amounts to 9*s.* per annum per lamp.

VARIETIES.

A NEW church is shortly to be erected at Brightlingsea at a cost of 8,000*l.*

THE Clacton Urban District Council are contemplating the erection of a sea-wall at an estimated cost of 25,000*l.*

THE Home Office authorities propose enlarging His Majesty's prison at Brixton by the addition of 200 cells.

AT a public meeting on Tuesday at the Dover town hall approval was given to the Corporation's scheme for a viaduct road at a cost of 42,000*l.* in connection with the harbour improvements.

THE burgesses of Croydon have by a majority rejected a proposal to carry through a Bill insuring an increased water-supply at a cost of about 260,000*l.* A severe drought is said to be possible under the existing conditions.

THE Chairman of the Mersey Docks and Harbour Board, in his review of the work of the year, stated that a Bill lodged in Parliament would if passed enable them to carry out extensions at an outlay of more than four millions sterling in eight years.

THE Coventry education committee have approved a recommendation that a secondary school for girls, to accommodate from 250 to 300 children, between the ages of eleven and eighteen, be built on a site to be provided. The cost is estimated at 12,750*l.*

THE Kensington Borough Council on Tuesday accepted with thanks the offer of Sir Walter Phillimore to surrender to the public over 13,000 feet of land for the widening of Kensington High Street, Hornton Street, Phillimore Mews and Campden Hill Road.

THE promoters of the Edinburgh Exhibition have, in deference to the wishes of the executive of the Dublin

"MAXIMUM LIGHT GLASS."

LENSES AND PRISMS COMBINED IN ONE SHEET.

ABSOLUTELY THE BEST FOR DAY-LIGHTING DARK INTERIORS.

Increases the Daylight from 5 to 20 times.

By reason of a lens surface running vertically on the outside and at right angles to an interior prismatic surface, this glass possesses a double refractory power.

All the light from the sky is gathered, projected, and completely diffused.

The use of the "Maximum Light Glass" lessens the cost of artificial lighting.

Supplied in ordinary window-glass sizes.

Also in ornamental designs in lead or copper.

Exhibition, postponed the date of the proposed undertaking till 1908, so as not to clash with the Irish proposal. The Dublin Exhibition will open in May 1907.

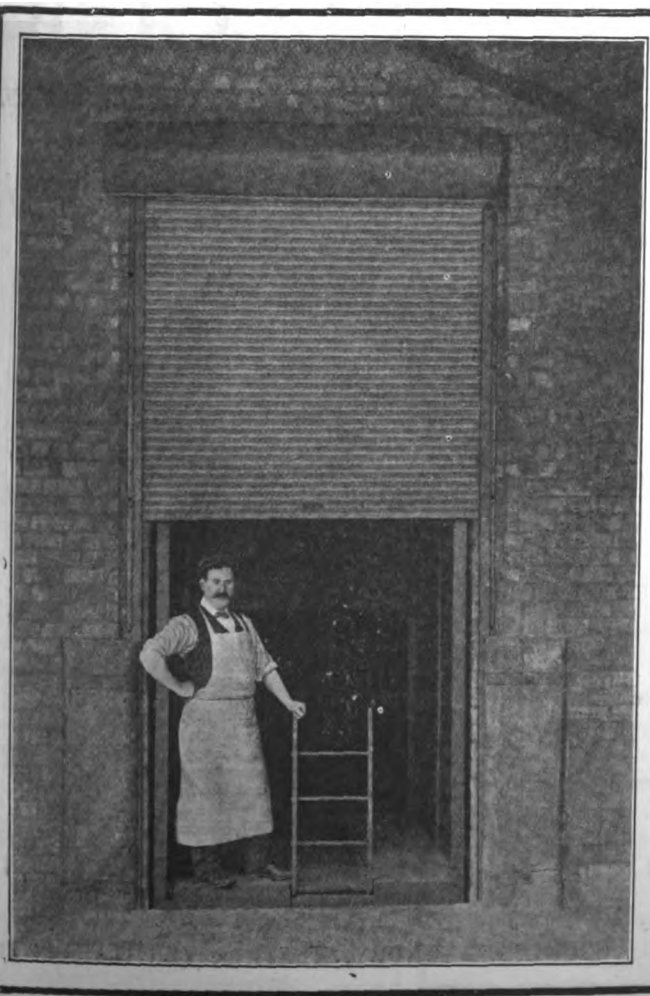
DR. A. WINTER BLYTH, medical officer of health for Marylebone, reports that vibration consequent on heavy motor traffic and underground railways is affecting more or less seriously the whole Metropolis along the main channels of traffic. Instances have occurred locally of absolutely new drainage becoming defective from fracture of the pipes.

THE Local Government Board have sanctioned the loans (county) as follows:—The elementary schools, Great Bentley, 225*l.*; Wivenhoe, 381*l.*; and Laindon, 168*l.* For higher education, for the erection of the new secondary school, Braintree, 9,000*l.*, and for extra accommodation at the Ilford secondary school, 5,000*l.*

PLANS have been passed for the erection of a Roman Catholic church and presbytery in Morningside, Edinburgh. Only part of the building is to be proceeded with at once, and it will accommodate a congregation of 300, but the completed building will seat about 700. The plans have been prepared by Mr. R. S. Lorimer.

AN inquiry has been held at Stafford by Colonel Hepper with respect to an application made by the Staffordshire County Council to the Local Government Board for power to borrow 75,000*l.* for the purpose of carrying out extensions, alterations and additions to Cheddleton Asylum, rendered necessary by the increase of lunacy.

AT the annual general meeting of the Master Builders' Association of Ireland the following officers were elected for 1906:—President, James Beckett; vice-president, Richard Denne Bolton; committee, Thos. Conolly, J. E. Foley, James Kiernan, Thomas Mackey, H. M'Laughlin, Henry Pemberton, B. W. Whyte and E. Warren; hon. treasurer, Samuel Roberts; hon. secretary, John Good.



THE report of the Local Government Board *re* the application for sanction to a loan of 37,490*l.* for the Crowborough sewage scheme has been received. The Board have sanctioned a loan of 37,110*l.* The Board have also assented to a modification of the agreement for land, so as to allow of an alteration of the method of treatment, with the Board's approval, if found necessary or desirable.

AT a special meeting of the Tamworth Rural District Council the surveyor (Mr. H. J. Clarson) produced plans for the proposed sewerage scheme for the parishes of Bolehall and Glascote, Wilnecote and Castle Liberty, and Fazeley, and parts of the parishes of Amington and Stonydeph, in connection with the joint disposal works of the Tamworth Corporation. The estimate of the cost was 28,670*l.* A sub-committee was appointed to arrange with Mr. Midgley Taylor to consider and report on the scheme as a whole, and the estimates relating to it.

MR. JOHN WALKER, head of the firm of Walker & Slater, builders and contractors, Derby, died last week at the age of 64. Messrs. Walker & Slater were the builders of many important structures, including the present buildings of the Derbyshire Royal Infirmary. They also erected several churches, the latest of which was Trinity Church, London Road. They carried out the restoration of St. Peter's Church, and were the builders of Byrkley Lodge, the palatial residence of the late Mr. Hamar Bass, Stamford Hall, Burton Workhouse, and all the buildings on the Dore and Chinley branch of the Midland Railway.

TANK CHIMNEYS.

WHEN chimneys were used as ventilators it became evident that they could pay a double or multiform debt and serve other uses besides the withdrawal of smoke. It was a happy thought of Messrs. Heinrich Winby & Co. to employ them for the support of tanks. The chimney is unaffected by the addition, which encircles the exterior at any height that is desired. There is always, therefore, water which, being at an elevation, is applicable for various purposes, with advantages which are not derivable from ordinary pipes. This ring is formed of wrought-iron, and is supported in such a way that the brickwork or other material in the chimney cannot suffer. This new mode of water supply will be invaluable in many places, and it has the recommendation of affording an economical source. Messrs. Heinrich Winby & Co. are specialists in chimney construction. Their experience therefore enables them to introduce many improvements in their erection. It suggests the degree of strength they adopt when we find that their calculations are based on the pressure of a wind with a

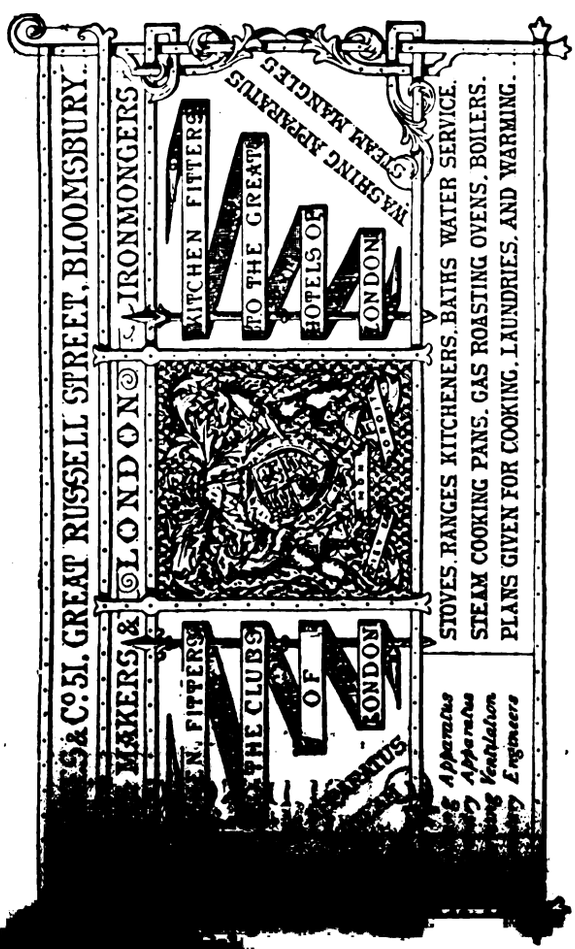
velocity of 100 miles an hour. They are also careful in their choice of bricks. A well constructed chimney, they believe, does not need any apparatus for producing draughts.

EUREKA SLATES.

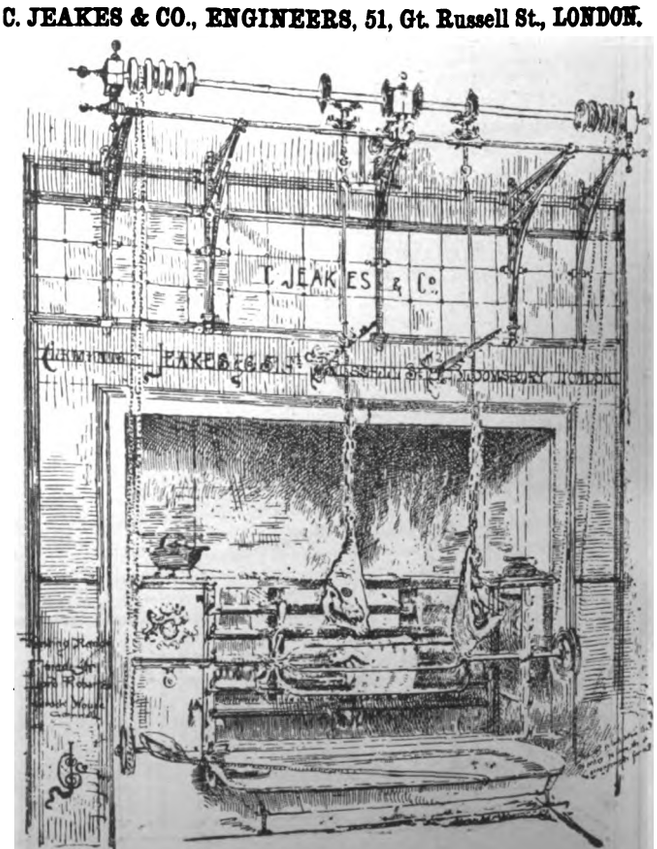
WE have received the following correction from Messrs. Roberts, Adlard & Co. concerning a paragraph which appeared in the "Contract Reporter" of the 5th inst. :—"Your writer, in transcribing Mr. Ambler's very clear withdrawal of his original remarks, has considerably missed the point. Particularly Mr. Ambler did not originally say they were 'thinner than Westmoreland' slates, but that they were a thin slate—a very different thing; and the last two lines, regarding change of colour, so far from embodying Mr. Ambler's explicit statement that he was satisfied they did not, would certainly tend, we fear, to leave the impression that they do change colour, but that in some exceptional circumstances we could guarantee they would not."

STANDARDS OF LENGTH.



THE importance now attached to the recommendations of the Standards Commission makes it indispensable that standards of length should be used about the accuracy of which there cannot be any misgiving. Messrs. F. W. Stanley & Co., who always endeavour to meet the special requirements of the time, have produced a series made of "Invar" and nickel steel, which may be considered as practically without expansion, and which are adapted not only for use in engineering works, but for the testing of measures in city and borough offices. They possess the advantage of being available for (1) an inside standard gauge; (2) an outside standard gauge, and (3) a standard scale gauge. Messrs. Stanley keep in stock triple standard yards, triple standard 2 feet, triple standard 1 foot and triple standard metres; these can be obtained separately or together in a case. They are graduated with extreme accuracy and are all certified by the National Physical Laboratory. Other appliances in "Invar" steel are also manufactured by Messrs. Stanley.

NEW CATALOGUE.



MESSRS. G. SHREWSBURY & Co. have gained a reputation by the various forms of their Caldas, by which hot water is quickly obtained in houses and buildings where there is no special system provided for the purpose. The prices, of course, vary. Messrs. Shrewsbury likewise manufacture varieties of baths, some of which are adapted to be heated by gas directly, while others are arranged with a Calda. Moreover, they supply the Ellkay folding bath, which is a boon for occupants of chambers. The heating of conservatories is another class of work for which special apparatus can be obtained. Washing coppers, water cisterns, stoves and radiators are shown in which gas is the heating power. In a word, the catalogue suggests numerous ways of meeting difficulties by people who are compelled to be economical.

THE ALBION SPRINKLER.

THE advantages of sprinklers for overcoming the early stages of a fire have been too often demonstrated to require further explanation. In America they are considered to be essential by some of the principal fire offices, and an elaborate series of rules respecting them has been prepared. Any doubts which are entertained about their efficiency arise from apprehensions about the pipes and valves acting at the crucial moment. Many varieties of apparatus for extinguishing fires, although they create confidence in the owners, fail when their services are required, and on that account there is a prejudice about the value of excellent inventions. The Albion sprinkler has a simplicity which offers nothing to get out of order. It is made to operate by the enemy it is destined to overcome. The pipe is kept closed by a simple apparatus that depends for its efficiency on the use of a solder. When the heat reaches about 160 degs. Fahr. the solder dissolves, the pipe is open and sprinkling begins. What is more, the action of the sprinkler sets in motion an automatic fire alarm. If desired, there is a dry pipe valve which obviates risk of freezing, and which is no less simple in action and equally effective in distributing water. The principle is scientific, and the whole apparatus is adapted to meet unexpected emergencies. The sprinklers are manufactured by the Albion Sprinkler Company.

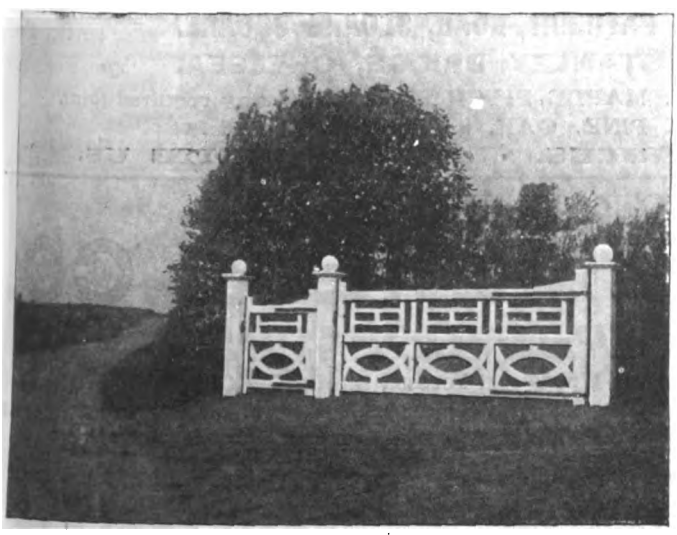
THE REGISTRATION BILL AND THE GENERAL ELECTION.

IN view of the reintroduction of the Society of Architects' Bill into Parliament early in the forthcoming session, the Council has circularised every Parliamentary candidate, calling attention to the Bill, giving a brief synopsis of its scope and object, and inviting the candidate to record, by means of a prepaid postcard, his agreement or otherwise with the principle of a statutory qualification for architects, and his intention, if elected, of supporting the Bill. A letter has also been sent to the members of the Society asking them to support the Council's action by writing to their local Parliamentary candidates to a similar effect, and there are indications that this co-operative action is having good results. Many promises of support have already been received and are still coming in.

NATIONAL FEDERATION OF BUILDERS.

THE annual meeting of the Midland centre of the National Federation of Building Trade Employers of Great Britain was held at the Acorn hotel, Birmingham, on the 11th inst. The chair was taken by Mr. F. G. Whittall. The annual report stated that three important questions had been discussed during the year—the secretaryship of the National Federation, the national reserve fund, and the establishment of conciliation boards. In regard to the national reserve fund, the amount to be raised by the National Federation is 10,000*l.*, of which the Midland district has to raise 1,200*l.* Up to the end of the year the sum promised in the centre was 874*l.* The Midland centre had approved of the scheme prepared by the Northern Federation for the establishment of national and central conciliation boards, and it is hoped that the formation of these boards will do much to prevent strikes and lock-outs. In reference to the Trades Disputes Bill, it was pointed out that the Prime Minister had promised similar legislation in the event of his party being returned to power. If he were in a position to redeem his promise, it behoved all employers of labour to see that no undue power, in regard to picketing especially, was placed in the hands of the trade unionists. The following officers for the ensuing year were elected:—President, Mr. F. G. Whittall; vice-presidents, Councillor Dallow (West Bromwich) and William Winstance (Walsall); treasurer, Alderman J. Bowen; hon secretary, Mr. Albert S. Smith; auditors, Mr. H. Smith (West Bromwich) and Colonel Barnsley.



INLAID BRASSWORK AT CAIRO.

THERE is a considerable demand at Cairo each year, says Mr. W. L. Hildburgh, in the *Journal of the Society of Arts*, for brasswares of various kinds, in the form of utensils and ornamental objects. Amongst these wares the richest in effect, and that requiring the most skill for its perfection, is inlaid with silver or gold. The greater part of the pieces of this for sale in the Cairo Bazaar are, however, made in Damascus, where labour is considerably cheaper than in Cairo, and where many more workmen are engaged in the production. While in Cairo, it is said, there are only about thirty men skilled in inlaying, in Damascus there are several hundred; on the other hand, the quality of the Damascus work is said to be inferior to that of the best Cairene.

Although the art of encrusting metal on metal is of considerable antiquity amongst the Arabic nations, the ancient specimens of encrusted work are to-day, in Egypt at least, quite rare. In appearance the applied metal consists of thin sheets in the form of lines, geometrical figures, scrolls, diapers, Arabic inscriptions, conventionalised birds and animals and broad areas, which, for the most part, are slightly raised above the body and are burnished; in some objects they are also engraved. The whole of this decoration is, however, applied in the form of wire, which is afterwards flattened by hammering.

The metal for the body is usually brass, upon which may be silver, less frequently copper or silver-gilt, and rarely, on account of its cost, gold. Generally the copper and gold are used only in conjunction with silver to enhance its effect. The objects decorated are mainly ewers, jugs, trays, coffee-pots and cupholders, hanging lamps, boxes and the like. Some of the pieces are of considerable size, elaborately covered trays, 24 to 28 inches in diameter, being occasionally to be found.

Both rolled and cast brass are used for the bodies to be inlaid. The cast metal is employed for small pieces, such as coffee-cup holders, when it is desirable that each should be of a single piece and solid, though it is more difficult to work than, and does not hold the silver so well as, the wrought metal. The bodies are imported from Europe ready-shaped or are made in the bazaar; the former are spun or cast, while the latter are bent, hammered and soldered, or are drawn seamless by hammering. An idea of the methods employed is best to be obtained by following a special piece, such as one of the small Arab coffee-pots, from the smooth sheet to completion.

The coppersmith, having received the specifications of the object, furnishes the body, spout, cover and bottom separately to the manufacturer. Each piece is then filled with a melted bituminous compound, which hardens to a tough solid, and passes to the engraver, who, working without patterns or preliminary sketches, draws the design directly upon the brass with a writing brush and ink. Having chiselled it, he delivers the pieces, now decorated in the manner of the greater part of the brassware sold.

Next the pieces go to the inlayer, upon whose skill the beauty of the finished object will mainly depend, and whose tools are a light hammer and three chisels. The head of the hammer is square at its shorter end, and tapers to an oblong at its longer, the square end being used to strike the chisels and the oblong to fix the wire in position. One of the chisels tapers gradually to a point, and is used for the correction of faults in the engraving; the second is a long narrow wedge with its edge brought to a point by grinding back at an angle from one corner, and is used to cut the holes by which the wire is held, and the third is a very narrow wedge for severing the wire at the end of each line.

The inlaying is done in small sections, the workman going over one of these with his second chisel, cutting a line of very closely-placed holes, each of which has a sharp little point of forced-out metal at one side; by means of these little points the wire is caught and held. The wire is placed at the beginning of a line and is carried along it, being forced into position by sharp taps of the hammer, and at the end of the line is cut by the third chisel. For broad surfaces the lines are made parallel and adjacent, and when the wires have been laid sufficiently close and the work properly finished, it is often impossible to see the edges of juncture, the whole presenting the appearance of a solid sheet. When well laid the wire, which is of a very soft, pure silver, will break when pulled, rather than leave the brass.

A good workman will generally lay from 24 to 32 inches of wire per day of ten hours, depending on the care he exercises and the quality of his work, and will receive from six piastres (one piastre equals twopence halfpenny) to twelve piastres per day, according to his skill. These wages are high, some brass decorators (those who fill in backgrounds or do similar work) receiving as little as two piastres per day.

The inlaying having been completed, the workman burnishes it with the broad end of his hammer, finishing with a curved steel rod of circular section. The pieces are then returned to the engraver, who decorates such of the silver surfaces as require further ornamentation, and also, for the best quality of work, carefully chisels the outlines of the inlaying where they appear rough. The decoration finished, the bituminous filling is removed by striking the pieces with a small wooden mallet, and by scraping off the small quantity of it which remains adherent.

The pieces are then returned to the coppersmith, who tins the interiors, punches holes for the exit of the coffee and attaches by soft solder the bottom, spout and handle and the hinge and knob of the cover. Finally, after cleaning, the exterior is rubbed with black to bring out the details of the engraving. Such, with minor modifications dependent on the shape and quality of the objects, are the steps followed in the making of all inlaid work of this character.

The faults to be found in objects so decorated are as follows:—The wire is missing from parts of the prepared surface, or is loose, due to imperfect preparation, this being especially liable to occur with cast-brass bodies. The cutting off of the wire is carelessly done, giving a stepped appearance to the outlines of a broad surface. The holes are too deep for the size of the wire used so that the silver lines have wavy edges. The parallel lines of holes for a broad surface are too far apart for the wire used, cracks showing over the silver surface or even irregular lines of

brass being visible. Occasionally when the brass has proven bad locally the parts which have refused the wire are tinned, giving them a dull, flat, leaden appearance, observable at a considerable distance.

TRAINING OF BUILDING WORKMEN.

A MEETING of the Royal Victorian Institute of Architects was held to consider the subject of the "Education of the Workman." Reports of the four papers read on that occasion occupy the latest part of the Journal of Proceedings of the Institute. The following is from one by Mr. John Murray, of the Master Builders' Association of Melbourne:—

Some of us make the mistake of being too conservative, and by clinging to old methods and ways of working we really seek for workmen who are behind the times. For example, it is said:—"Building in New York has ceased to be a thing for architects and masons; it has become a thing for engineers and rivetters." When I went to the trade the bell-hanger was an important man on a building. Nobody wants a bell-hanger now. Then we had speaking-tubes, generally full of microbes. Let us hope that both tubes and microbes have gone for ever. Telephones are now the order of the day, to be succeeded in a few years by ethergrams. It is harder to get a good inside plasterer at the present time than it was a few years ago. The introduction of fibrous plaster ceilings, and of factories where modelling is done by specialists, has knocked the heart out of the inside plasterer. Fibrous plaster, in its turn, is threatened by the stamped steel ceiling, manufactured in the art factories of Germany. Tradesmen are quick to adapt themselves to new ideas and ways of doing work, as it is usually along the line of least resistance. In other words, in many of our trades the hard manual parts, thanks to machinery, have been much reduced of recent years.

The introduction of machinery into many of our trades has also completely altered the qualifications required of workmen. The old-style shoemaker has almost passed away. The new expert in the same trade could not make a shoe to save his life. One of the leading bootmakers of Melbourne told me that this was not only true, but a desirable state of affairs. He runs his factory to make boots, and thinks the repairing of same by the old class of tradesman an injustice.

A few years ago every new building was a joiner's shop and the apprentices had a chance of acquiring manual dexterity in many operations now performed by machinery. Of the splendid men who came out here in the early fifties many of them were taught their trades from top to bottom. The joiner went out into the woods in winter and felled the trees, which he afterwards worked up. We have to lament that we very seldom get men from the country districts now. You will get the answer to this if you keep your eye on the entrance to the goods yard of the Victorian railways. Dray loads of all kinds of manufactured building materials are constantly going in because they can be manufactured cheaper in the city factory than it is possible to make them in the country.

The members of this Institute will bear me out in the statement that we have a large percentage of imperfectly-trained men in some of our trades. I know you gentlemen have your doubts at times whether the builder is doing his best for you and for the proprietor in the matter of good workmanship. In this matter the best is always the cheapest, and builders are quick enough, I think, to find that out.

For this state of affairs the Victorian Governments of the past are largely responsible, as they have done absolutely nothing in the way of training men for the State service. Quite recently the Railway Commissioners appointed a number of apprentices, who were required to immediately enrol as students at the Working Men's College, and to attend the classes of instruction appertaining to the trade to which they were individually apprenticed. This is a step in the right direction, for it is manifestly unfair that the general public should be called on to train workmen for the Railway Commissioners and other branches of State industry. It is worthy of note that State apprentices are required to give up part of their evenings to the Working Men's College, that they must pass in proper sequence the examinations prescribed for each year, and, in addition, shall do satisfactory work and be of good conduct in the service of the Commissioners, otherwise their services may be summarily dispensed with. You will notice that they are not apprenticed. Private employers would not be

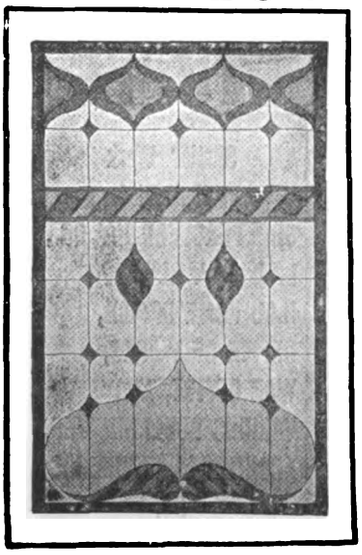
allowed to impose similar conditions. It is actions of this nature which have, in the opinion of the Labour party, earned for Newport the name of the "greatest sweating shop" in the State.

Another matter which works against the production of good men is the subdivision of labour, making the lives of men more mechanical. Men naturally desire to see the fruits of their labour and have it praised. All ambition and desire to excel being killed in a man, he looks more and more to outside things to interest or amuse as the case may be. I am inclined to think this is at the bottom of a lot of the discontent so prevalent in all ranks of labour, and accounts for the great numbers who are desirous of leaving off work and joining the club at the top of Bourke Street, where they get free railways, free amusements, free billiards, &c., and 6*l.* per week. The present movement to have all buildings wherever two men are employed proclaimed a factory is one that I think ought to be resisted by the members of this Institute.

That every man will be entitled to the standard rate of wages, whether he is worth it or not, must in busy times enormously increase the cost of buildings. The promoters of this movement hope not only for increased pay, but that the number of apprentices be kept within bounds. He was glad to learn that evening that the Royal Victorian Institute of Architects had appointed representatives to join the deputation to the Minister of Labour on the following day.



The education of the workman is arousing world-wide interest at the present time. Practical British reformers, like G. R. Sims, J. S. Bullen and others, who have studied the grave industrial problems involved, are urging that the State should take the matter in hand, ignore the wrath of the unions and revive the system of apprenticeship. Most of us have read John Foster Fraser's book, "America at Work." As a writer he appears to have the knack of talking in a very learned manner about subjects of which he knows very little. His chapter on "Training in Philadelphia" is, however, well worth reading. Speaking of technical schools, he says:—"These technical classes have made the apprenticeship system, such as we have in England, absolutely impossible. For many years the managers of Baldwin's locomotive works have been trying to find a satisfactory apprenticeship scheme. They have three classes, and the first of these is, I think, worthy of explanation. They will accept lads of seventeen years of age, and bind them for four years, on the distinct understanding that the apprentices attend night school during the first three years, learning algebra and geometry in the first and mechanical drawing in the second and third years. They start with a wage of 2½*d.* an hour and end with 5½*d.* an hour. This is an ideal system for the employer and the boy." Under this system you will notice employers get what are practically young men who have been two or three years at the training schools, fitting themselves, as it is well put in the prospectus of our Working Men's College, "to enter intelligently on any line of industrial work and make rapid and satisfactory progress therein." The Baldwin Company gets these young men for much less pay than similar young men would receive under our Wages Boards. We need not wonder that under such conditions America can more than hold her own in the industrial world. This is an ideal system for the youth of Australia. No work until they are seventeen years of age. If we had this system for a few years we would soon have the ashes of cricket back again. It would be hard on the average parent, I admit, but I do not see any chance of such a system being introduced here. I only mention it to show how far we in Australia have fallen behind the times, and because we often hear of the Baldwin apprentices. The other two classes go so far beyond my part of the subject this evening that it is unnecessary to say anything about them.

At the last conference of the Federated Master Builders' Association of Australia, the following was suggested as a remedy for the existing unsatisfactory conditions. Briefly put, it recommended:—

1. That the indenture system of apprenticeship be re-established. 2. That the system of employing improvers be abolished. Ways and means for carrying out this were suggested. 3. That the indenture should contain a covenant binding the apprentice to attend a technical school where such is available. 4. That a standard of efficiency should be established.

I would suggest that all firms who desire and can give apprentices a proper training be allowed to do so under the conditions that prevailed before the passing of the Factories Act.

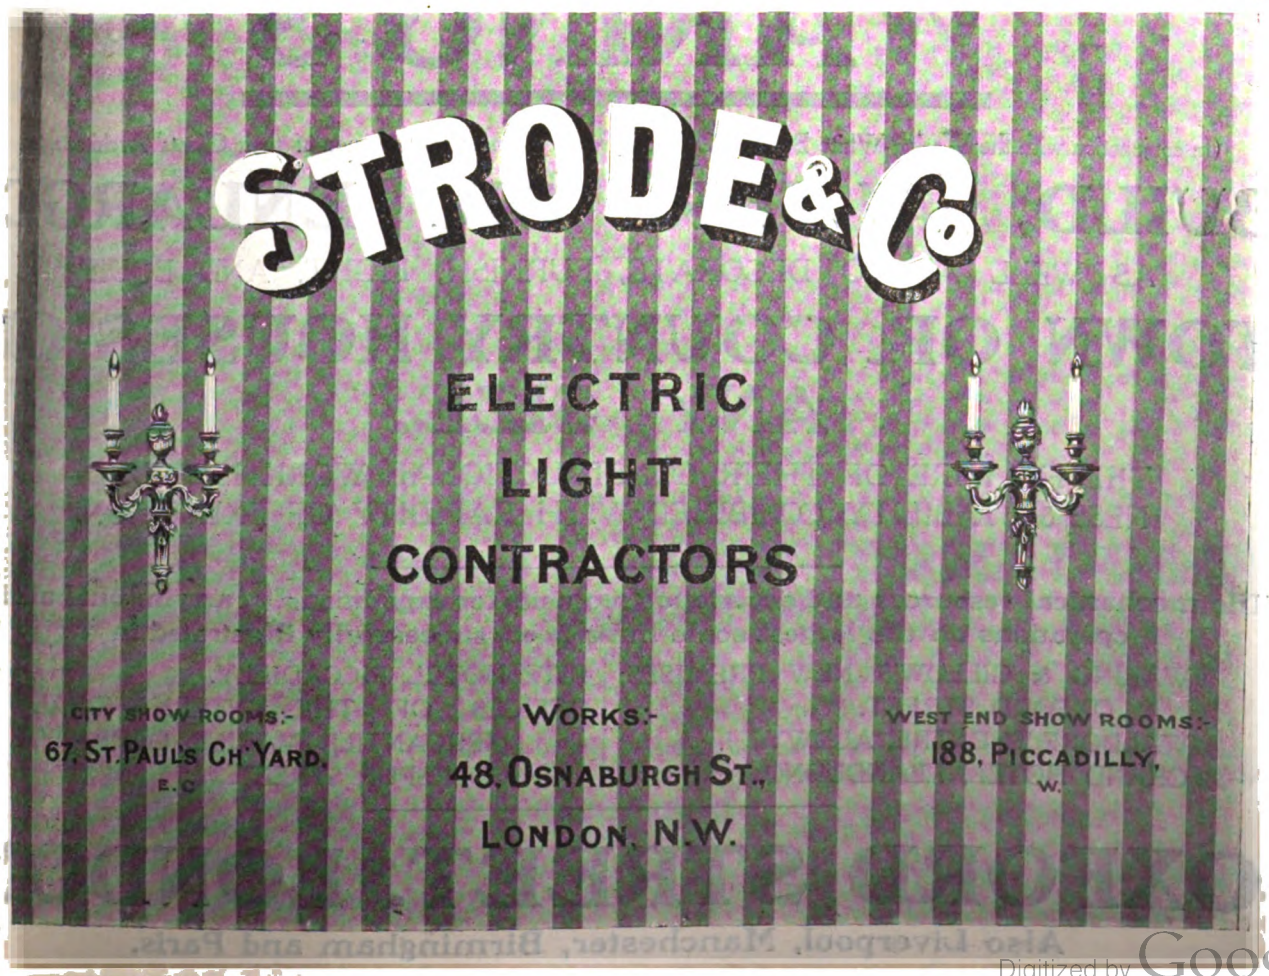
Our firm has for over forty five years trained boys from start to finish. They can be found now filling all the positions that usually fall to the lot of well-trained men. Not one of them was ever indentured. In the past we never encouraged improvers, because to take an improver into a shop or on to a building is a great injustice to those who are junior to him. Of course, we only employ improvers now so as to comply with the Act.

What system could be worse than prevails in Melbourne of allowing boys freedom of contract for their labour, plus 2*s.* 6*d.* per week over boys who are apprenticed? A system which extends the apprenticeship in some cases over twenty years must be bad. Put an advertisement in a Melbourne daily for improvers at 7*s.*, 8*s.* and 9*s.* per day and you will get applicants up to forty-five years of age.

You will have noticed one thing, gentlemen, which holds good in all the systems mentioned of educating the workman. The Working Men's College disclaims all intention of trade teaching. The Railway Commissioners take the entire practical training of apprentices into their own hands, wisely leaving the theoretical part to the Working Men's College. Exactly the same thing obtains at Baldwin's.



We have some of the finest tradesmen in the world in Melbourne at the present time, quick and also good. If we had any system at all of apprenticeship here, and a school like the Working Men's College to impart theoretical instruction—or to use your own words, sir, in speaking of young architects, "improve himself by reading up those branches which are not actually being carried out in the office," or the workshop in the case of young tradesmen—there is no reason whatever why the number of high-class and really good workmen should not be largely increased.

FIRE PROTECTION OF THEATRES.

THE subject of an address by Mr. John R. Freeman before the American Society of Mechanical Engineers at the annual meeting was the safeguarding of life in theatres. He can speak of it, says the *Engineering Record*, with the authority that comes from a lifetime of study of fire protection and fire-resisting construction. In the introduction of his paper he pointed out that the protection of theatres against fires was far behind protective measures used in industrial plants, and that this condition was a wrong against the public that should be righted at once. In his opinion, safeguards, to be ample, are mostly simple, and the main features of many of them have already been worked out and tested in theatres and shops. The additional safeguards which must be worked out for theatre purposes—automatic smoke vents, a safe proscenium curtain, a safe method of warming and ventilation, and proper arrangement of automatic sprinklers on the stage and in dressing and store-rooms—are all problems that do not impose a great strain on engineering ability. Mr. Freeman pointed out that the subject was one eminently fitted for the consideration of engineers, because a precedent was afforded by the official investigation made by the Austrian Society of Engineers after the burning of the Ring Theatre in Vienna, the results of which were republished by that organisation after the burning of the Iroquois Theatre.

In his paper Mr. Freeman pointed out features in which the experience gained in fire-protection engineering in other classes of buildings can be applied in theatres. The need of such application of experience is thoroughly shown by some of the facts mentioned. For instance, he mentions seeing in one of the best New York theatres a wedge-shaped space beneath the sloping floor of the auditorium used as a plenum chamber for ventilation employed also as a storeroom for trunks and properties. This resulted in a fire risk of the worst character. He also mentions finding in one of the most famous American auditoriums the portable wooden flooring sometimes used to transform the main hall into a ball-room stored in a dark passage-way forming the main air-chamber between the heating coils and concert-hall. This flooring was thus kiln-dried to perfection and ready to be burned at the slightest provocation.

Any one who has visited theatres, even the best of them in our largest cities, does not need printed statements to recognise the gravity of the slipshod, reckless management of such buildings. For some reason or other the precautions against fire which are taken in theatres are perfunctory, and the lesson of the Iroquois fire seems to be wholly un-

Digitized by Google

learned by managers generally. Mr. Freeman well says in the close of his address that what is necessary is a law emphasising fire prevention by inspection rather than a law that mentions various things theatre managers shall not do. The affirmative legislation is always stronger than the negative, and this point brought out in the paper deserves careful thought.

The value of the paper in some respects is made particularly strong by the astonishing information it contains concerning many of the constructions and materials relied upon for fire prevention in theatres. The statements concerning smoke vents show that some of the designs that as copies are entirely satisfactory are really of little use owing to defective details. The experimental results reviewed in this portion of the paper are particularly valuable, not only because the importance of these vents in theatres is very great, but also because similar smoke vents must be installed in the buildings for certain industrial purposes, and the information in the paper is correspondingly valuable to mill architects.

Automatic sprinklers for theatre use Mr. Freeman ranks as second in importance only to smoke vents, although probably very few of them have ever been installed in such buildings. He discusses the method of using them and the possibility of damage through leakage of some of the sprinkler heads, and makes a very strong plea for their installation.

A third precaution which demands study is the curtain for closing the proscenium arch. This portion of the paper is one which will attract very wide attention. In addition, the materials and construction of such curtains are gone into at length and the conclusions reached by Mr. Freeman from careful tests of curtain material, and an examination of curtains in theatres where there have been fires, leads him to the conclusion that a great deal is to be learned concerning this detail of theatre appointments. The fire-proofing of scenery is also discussed at length, and it is evident that Mr. Freeman does not put very much reliance on chemical treatment for preventing fires; the most the treatment will do is apparently to retard the process of catching fire. The paper closes with a discussion of fire escapes and fire extinguishers. Most of the latter materials seem to be common cooking soda more or less doctored with pigments in order to change their colour and sell at prices far above the commercial value of the materials used.

TIMBER TRADE IN GLASGOW.

PERHAPS the most remarkable feature in the year's trade of this district, says the *Glasgow Herald*, has been the high level of prices to which nearly all descriptions of timber have attained—the highest, indeed, ever recorded. Various explanations may be advanced as contributory causes, but the principal one undoubtedly is a largely increased demand for wood goods in other countries, with a consequent reduction of consignments to the Clyde and other British markets, which have been so plentifully supplied in the past. That the present conditions are likely to prevail in future seems reasonably certain, for even assuming the by no means improbable contingency of the output exceeding the demand, it is no longer likely that the shippers' old remedy of flooding the British markets with surplus stock would be resorted to. Quite a number of sound arguments might be put forward to support this view, but a few will suffice. For example, there is increased cost of production to reckon with, which will have a tendency to check indiscriminate consignments, and more important still, the trade has gone into fewer and stronger hands, whose business and whose interest it is to study the various market requirements abroad and arrange that the supply and demand be reasonably proportioned, so as to secure stability and maintenance of values.

While high prices have been the feature throughout the year, there have been several specially prominent examples where the advance has been of the phenomenal order. Pitch-pine and teak have been cases in point, prices having reached the highest level ever recorded. In both instances the rise has been occasioned by diminished supplies and increased local demand, and as no suitable substitutes for either have so far been discovered there seems nothing to prevent prices reaching a still higher level. Among other items which have appreciated considerably, though in a lesser degree, may be mentioned Canadian spruce, elm and birch, the demand for all of which has been active.

ARCHITECTS AND BUILDERS PLEASE NOTE.

CALL AND SEE THE PATENT "GASCOL" STOVE.

The special attention of all Architects and Builders is called to the "GASCOL" patent stove, which is a self-setting stove, which can be heated by either gas or coal, or both at once, effecting a great saving when a small fire is required for warming purposes.

Some Striking Advantages of the "GASCOL."

The "GASCOL" patent stove is constructed on scientific principles, and is exceedingly economical in use, the Oven, with tap full on, consuming but 10 feet of gas per hour. It is strongly built and the fittings are of the best quality. The change can be made in a moment from coal to gas, or *vice versa*. The Gas Hot Plate is fitted with one Boiling Burner, one Simmering Burner, and one Combination Griller and Boiling Burner, with Rise and Fall Double Deflectors, along with a strong tinned Grill Pan and Grid. The Oven is fitted with two Burners, two Runners, one Grid Shelf, and one Browning Sheet, all of which are detachable, and can be easily removed for cleaning. The Gas Connection can be made either at back or front of the Range. The "GASCOL" is simple in action, automatic in working, and is the ideal cooking stove for villas, flats, &c. It is, moreover, exceedingly moderate in price. All Architects and Builders are requested to call and see the "GASCOL" at any of the leading Wholesale Ironmongers, or it may be seen in operation at the showrooms of

AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy Work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

THE

Architect and Contract Reporter.

FRIDAY, JANUARY 26, 1906.

Published weekly, subscription 19s. *per annum for Great Britain, and for Colonial and Foreign subscriptions* £1 6s. 6d.
All business communications to the Managing Director,

P. A. GILBERT WOOD,

Publishing Offices, 6-11 *Imperial Buildings, Ludgate Circus, London, England.*

*** *Entered in the United States of America as second-class matter. Agents for America, The International News Co.,* 5 *Bream's Buildings, Chancery Lane, London, England, and New York.*

Important Notice to the Architects and Civil Engineers of Westminster.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Ltd., to establish Branch Offices in that district at 43 OLD QUEEN STREET, S.W., *Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.*

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

The Birmingham Offices are at 102 COLMORE ROW.

AGENTS FOR THE COLONIES.

MESSRS. GORDON & GOTCH,
Melbourne, Sydney, Brisbane, and Perth, Australia; Wellington, Christchurch, and Auckland, New Zealand; Launceston and Hobart, Tasmania.

SOUTH AFRICA—*Central News Agency, Ltd.*

Telephone No. 4725 Holborn.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

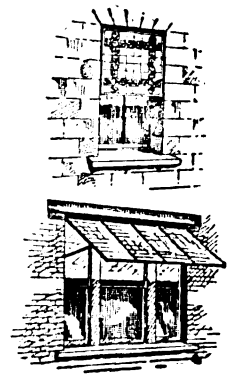
*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1s. The Town Clerk, Council House, Birmingham.

CROMPTON.—Jan. 31.—For a Carnegie free library. Premiums of 30*l.*, 20*l.* and 10*l.* are offered. Deposit 10s 6*d.* Instructions from Mr. F. F. Gartside, clerk, Town Hall, Shaw, near Oldham.

SCOTLAND.—March 12.—For a school at Cartsburn, for the Greenock (Burgh) School Board. Conditions, &c., from Mr. A. F. Niven, clerk, Burgh School Board Offices, Municipal Buildings, Greenock.



WALES.—March 20.—For a free library to be erected in Bangor at a cost not exceeding 3,000*l.*, inclusive of architect's charges. Premiums of 25*l.* and 15*l.* respectively will be paid to the authors of the two approved designs. Premium for successful design to merge into the architect's commission. Deposit 1*l.* 1s. Application to Mr. Wm. H. Worrall, clerk to the general purposes committee, Municipal Offices, Bangor, North Wales.

CONTRACTS OPEN.

ACTON TURVILLE.—Jan. 29.—For the erection of temporary stables at Badminton hotel. Deposit 10s. Mr. Frank W. Wills, architect, 8 St. Stephen Street, Bristol.

ANNFIELD PLAIN.—Jan. 29.—For the erection of cart-shed, oil-house, three-stalled stable, loose-box, &c., at Langley Park branch. Mr. Geo. Thos. Wilson, architect, 22 Durham Road, Blackhill, co. Durham.

LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS

AN EXPLANATION.—The Luxfer Prism is a flat-backed prism, and is the best for Daylighting dark interiors. The absurdity of any claim to the contrary can easily be demonstrated. Prisms with corrugated backs were patented by the Luxfer Company in 1897, and discarded in favour of a more perfect invention, viz. The Luxfer Prisms, that have been sold in this country during the past six years.

The British Luxfer Prism Synd., Ltd., 16 Hill St., Finsbury, E.C.

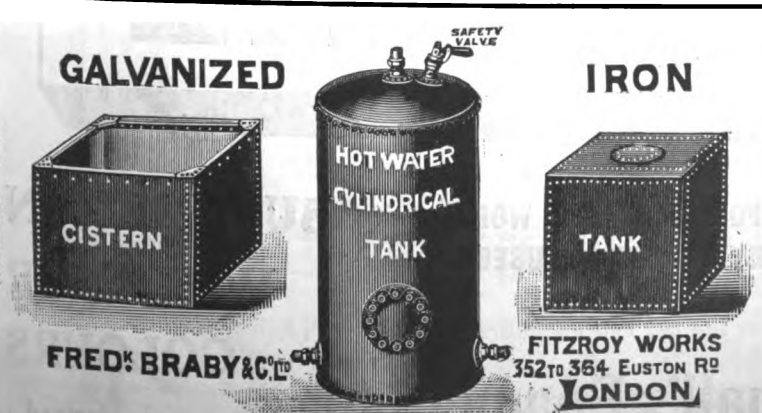
Head Office—2 MOORGATE ST., LONDON, E.C.

WAPLER'S VENETIAN BLINDS

Are fitted with a very simple and effective Check Action. (OWN PATENT.)

Are very light and elegant in consequence of the laths being extra thin. Are as easily worked and taken down as ordinary roller blinds.



There is nothing to get out of order. The wear on tapes and cords reduced to a minimum.

For all our Venetian Blinds we use only the very best selected Pine.

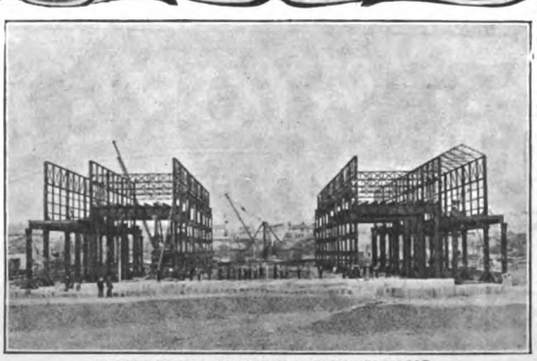
T-SQUARE CLUB.



THE first meeting of the above club as newly constituted was held last Tuesday, the 23rd inst., in the International Hall, Monico Restaurant. The proceedings opened with an invitation supper, followed by a concert. The chair was taken by Mr. E. G. Rivers, I.S.O, and amongst those present were Sir Henry Tanner, I.S.O., Mr. Herbert Steward, the immediate past president of the Surveyors' Institution, Professor H. Stannus, Mr. H. Wordley, I.S.O., the resident surveyors of Buckingham Palace and Hampton Court Palace, Lieut.-Col. W. H. Allen, Mr. Osborn Smith, Mr. C. Stephenson and Mr. A. Durrant.

The Chairman, in proposing the health of the Club, asked for an announcement as to its exact position, and the Secretary, in replying to same, stated that the club as now constituted consisted entirely of members of recognised professions who were solely engaged in professional practice, and the object of the club was to provide social evenings during the winter months.

The entertainment, which was carried out under the direction of Mr. J. Harry Pitt, was voted a perfect success, and was provided by Mr. Arthur Grover, Miss Marie Schulz, Lieut.-Col. W. H. Allen, Mr. Fred Curtis, Mr. Harry Vincent, Mr. J. Harry Pitt, Mr. Spurrell Groom and Mr. Wingrove Ives. Miss Marie Schulz and Mr. Arthur Grover were received with great applause, and the whole of the artists gained an encore on each occasion of appearing.

The toast of the evening was that of "The King," the others being that of "The Club," "The Visitors" and "The Chairman." The National Anthem opened the musical programme, and that and "Auld Lang Syne" closed the same.

All information regarding the club may be obtained of the hon. secretary, Mr. W. H. Webber, 7 Great James Street, Bedford Row, W.C.

DEPTFORD TOWN HALL.—COUNCIL CHAMBER.

FITTINGS, ST. PETER'S CHURCH, HORNSEY.

TRADE NOTES.

MESSRS. McDOWALL, STEVEN & Co., LTD., engineers, London and Glasgow, have secured the contract for the supply and erection of their steam and gas-cooking apparatus at Messrs. Bryant & May's factory at Bow.

MESSRS. GREENWOOD'S tender, amounting to 38,274*l.*, has been accepted for the new Lambeth town hall.

ON and after January 1 the firm of Messrs. G. R. McKenzie & Co., Ltd., has been taken over by Messrs. S. J. Waring & Sons, Ltd. The business will be still carried on under the title of G. R. McKenzie & Co.

THE Cheshire Lines committee are now erecting additional platforms at their Manchester central station, the roofs for which are being glazed by Messrs. Helliwell & Co., Ltd., of Brighouse, Yorkshire, and 11 Victoria Street, Westminster, London, with their patent Perfection system of glazing without putty.

MESSRS. RUFFORD & Co., LTD., of Stourbridge, and 30 Snow Hill, London, E.C., have secured a large order for their royal fireclay porcelain baths, to be supplied to the new public baths, Chelsea. They have also secured an order for twenty baths for the Reigate workhouse.

A LARGE number of business people have transactions with the various local authorities of this country. *The Local Government Annual and Official Directory*, edited by Mr. Sl Edgecumbe Rogers, and published at the office of the *Local Government Journal*, is therefore invaluable for reference. After fifteen years' experience the requirements of those who use the book must be well understood, and arrangements are made for carrying them out with accuracy and completeness.

WE have received from Messrs. Diespeker & Co., of 57 to 60 Holborn Viaduct, E.C., a copy of their Calendar for the year 1906, which contains views of some of the principal contracts recently carried out, and on the back an accident coupon for the sum of 500*l.* We have also to acknowledge receipt of Messrs. Samuel Elliott & Sons' (Reading) Calendar, which contains a reproduction of our illustration of the new doors at the Westminster Cathedral; and a handy little Calendar from Messrs. Johnson & Phillips, Ltd., the well-known telegraph and electrical engineers of Old Charlton, Kent.

NEW CATALOGUE.

MESSRS. RUFFORD & Co., LTD., have a claim on attention by the description of themselves which they give at the head of their price list, viz. "Manufacturers and original patentees of the Royal Porcelain Baths, for which the Gold Isis medal was awarded by the Society of Arts at the first International Exhibition, London, in 1851. They were originally made at the suggestion of the late Prince Consort." Another satisfactory announcement is that all their glazes are leadless and exceptionally hard. They show several varieties of their baths, some of them, considering the quality, being remarkably cheap. But they also make a variety of sinks, some being for use in hospitals, wash-tubs, city baths, &c. The business is carried out systematically, and from the catalogue every reader can understand what is offered to him. In addition to their baths and sinks, glazed bricks in white and ivory white, cream and buff, Rockingham brown, chocolate, black, grey, green and blue are also produced by the company. Another specialty of theirs is the manufacture of moulded bricks of numerous sections. The reputation of the company for sound work and honest dealing is too well established to need any comment.

MESSRS. PATMAN & FOTHERINGHAM, LTD., of Theobalds Road, W.C., and Islington, N., have been successful in securing the contract for the rebuilding of Nos. 132, 133, 134 and 135 Long Acre, W.C. (which were destroyed by the recent fire), the architect being Mr. William Woodward. These premises, when completed, will be used for very large motor warehouses.

ELECTRIC NOTES.

THE Blackrock Urban Council, co. Dublin, are negotiating for the transference of their electric-lighting order. An outlay of 150*l.* was incurred in promoting it. The committee recommend that a sum of 300*l.* should be required.

THE Coventry Town Council recently decided to expend 5,000*l.* on the purchase of electric motors to be let on hire to manufacturers who might desire to take the Corporation's electrical energy.

MR. H. R. HOPPER held a Local Government Board inquiry on Tuesday relative to the application of the Birmingham Corporation for power to borrow sums amounting to 132,690*l.* for the purposes of their electric supply undertaking.

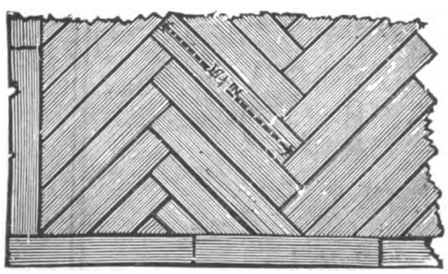
THE British Eastern Electric Power Company, Ltd., has been granted licenses to supply electrical energy for the working of an electric tramway and for public and private purposes within the area under the jurisdiction of the Municipal Board of Lucknow.

THE Yarmouth Corporation have made an arrangement with the Post Office under which the mails between Yarmouth and Gorleston will be carried in future on the electric tramcars. Seven journeys a day are required, and for this accommodation the Post Office will pay 22*l.* per annum, an economical investment, as a horse and cart have previously done this work.

THE Council of Armstrong College, Newcastle-on-Tyne, on Monday resolved to establish a chair of electrical engineering, and voted a sum of 2,600*l.* towards forming new electrical engineering laboratories. They also decided to offer for competition two scholarships, each worth 125*l.* annually, tenable by graduates at the College, on the condition that they spend their time in the prosecution of definite research.

THE electricity committee of Glasgow Corporation, as a result of correspondence with large engineering firms in the city with reference to the supply of electricity for power purposes at a low rate, recommend that where a supply of electricity is taken for power purposes of 500,000 units or more per annum, with not less than 2,000 hours use per annum, the charge should be $\frac{3}{4}d.$ per unit, subject to such conditions as it may be necessary to impose for the proper protection of the Corporation.

THE Association of German Electrical Companies, to which belong the nine largest firms of this class in Germany, have resolved to increase the recently introduced 10 per cent. advance in the price of dynamos to 15 per cent., the increase to take effect on February 25. The advance in the price of raw materials which took place during the last few months of 1905 is said to be the cause of this resolution.



A NEW system is to come into force at the dockyards as regards the drawing staff for electrical engineering, says the *World*. This department has of late years increased greatly in importance, and it is felt that much advantage will be derived by specialising it to some extent. With this view separate offices will be formed under the direction of electrical engineers. Not only will economy be promoted by this arrangement, but it is felt that work will be very much expedited and much more efficiently done. The new system comes into operation at once.

A CONFERENCE of local authorities is to be arranged to discuss the question of united opposition to the Lancashire Electric Power Bill. It is urged that the Bill aims at the exclusive right of municipal authorities to supply their own areas with electrical energy for all purposes, and that if such power be granted to private companies it will be most unfair and injurious to municipal undertakings, which have been set up at great cost and which are during a period of pioneering a considerable charge upon the local rates.

THE law and parliamentary committee of the Westminster Council in a report upon the London County Council Electric Supply Bill recommend the presentation of a petition against the measure. The committee express the opinion the Council must face the probability that during the early years the undertaking will show a deficiency which will have to be made good out of the rates, and they remind the Council that it will bear the whole financial risk of an undertaking dealing with an area over three times that of the county of London.

LORD CLAUD HAMILTON, in presiding over the half-yearly meeting of the East London Railway Company on Tuesday, in discussing the electrification of part of the system, said he did not pretend to be an expert in the matter of electricity, but he had the advantage, as chairman of one of their

large railways, of having the very best expert advice at his command, and he was not at all convinced in his own mind that the third rail system was either the best mode of electrifying a railway or the most economical and profitable manner of working it. His opinion had been rather confirmed by the unsatisfactory working of the Metropolitan and District Railways since they were electrified. As regarded the financial side of the question, judging from the report of the Metropolitan Railway Company just issued, it appeared to him that it was very doubtful whether the third rail was the best system, and there was no question that it was a very costly way of electrifying and working a railway company. The only mode of electrifying their line would be either to do it themselves or by means of the District or Metropolitan Railway, or the action of the leasing company as a whole. One of the leasing companies was so convinced in their own minds that the third rail was not the best that they had just let a contract for the overhead system from London Bridge to Victoria Station, and they maintained that the electrification could be carried out, roughly speaking, at two-thirds less cost than by the third-rail system. In face of that and until the experiment had been tried they might be quite certain that the Brighton Company would be no party to electrifying their line on the third rail system, and therefore he was afraid that the electrification of their line must be postponed until it was proved which of the two modes was the most efficacious and economical.

THE new London County Council school of marine engineering in Poplar was opened on Wednesday by Sir William Collins, M.P., chairman of the education committee of the Council. By means of an exchange effected with the Poplar Board of Guardians a site was acquired in East India Dock Road, and a building has been erected by the works department at a cost of 20,000*l.*, with a preliminary expenditure of 3,800*l.* for equipment, where instruction is to be provided in seamanship and navigation, marine engineering, naval architecture, general mechanical engineering, electrical engineering, pattern-making, carpentry, joinery and woodworking, theoretical and practical chemistry, physics and experimental mechanics.

VARIETIES.

MR. F. C. MOSCROP YOUNG, architect and surveyor, has removed his offices from 2 Lancaster Place, Strand, to Waldorf Chambers, Aldwych, W.C.

THE Durham education committee have adopted a report according to which thirty new schools are to be erected, at an approximate cost of 263,563*l.*, and twenty-three schools altered at an approximate cost of 11,368*l.*

MESSRS. CHAMBERS & MARTIN, architects and surveyors, have removed their offices from 2 Lancaster Place, Waterloo Bridge, to Waldorf Chambers, Aldwych, W.C., adjoining the Waldorf Theatre.

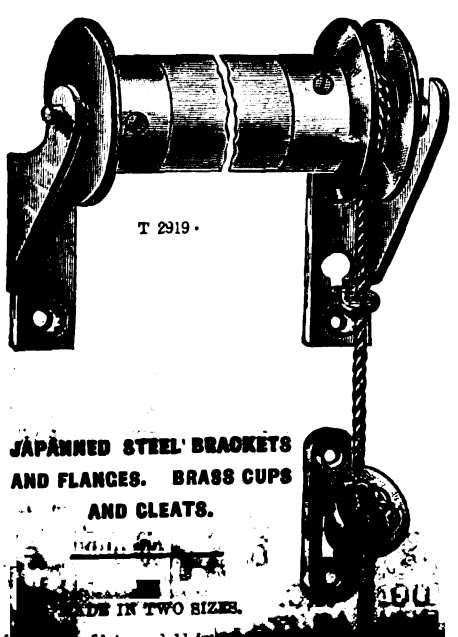
THE Sheffield Assay Office Bill proposes among other objects to acquire land not exceeding two acres for the erection or extension of buildings and new plant for the Assay Office.

SANCTION is being sought by the Rochester Corporation for power to borrow a further sum of 50,000*l.* for the purposes of street widening. They have already had on loan 70,000*l.* under their Street Improvements and Tramways Act of 1903.

THE Natal Government have given the contract for the supply and erection of cold-handling plant for the new harbour works at Durban to the Fulham Steel Works Company, Ltd., London. The job was obtained after international competition.

THE Kent educational committee propose to have the arms of the county set up on the Council schools. Mr. J. C. Edwards, of Ruabon, will supply ten copies of the panel packed and delivered, carriage paid, at any station for 20*s.* each.

A LOCAL GOVERNMENT BOARD inquiry has been held at Bradford into an application by the Corporation for sanction to borrow 275,000*l.* in respect of the acquirement of the Esholt Hall estate and certain portions of land in the parish of Baildon for the purpose of sewage disposal. The proceedings were formal.



THE Lambeth Borough Council have convened a conference representative of metropolitan city and borough councils "with a view of framing and adopting a uniform scale of trade union rates of wages and conditions for the

employés in each department of the different borough councils."

THE Kidsgrove District Council, after consideration extending over several months, have adopted a sewerage scheme for Newchapel, prepared by Messrs. Slater & Crimes, and it was decided to apply to the Local Government Board for sanction to borrow 12,000*l.* to carry out the scheme.

THE Edinburgh fire brigade report that the causes of the fires to which they were called in 1905 may be classed as follows:—Carelessness, 25 per cent.; defective building construction, 22 per cent.; accidental, 18 per cent.; not ascertained, 18 per cent.; negligence, 10 per cent.; children, 5 per cent.; paraffin lamps, 2 per cent.

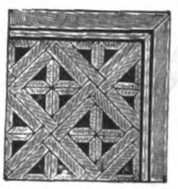
THE docks committee at Bristol are considering plans for sheds and a granary for the new dock at Avonmouth. The dock will have a water space of 30 acres, with 250 acres available for sidings and sheds. There will be 3,300 feet length of stone quays from which vessels will be able directly to discharge, with a further berthing space of 1,700 feet available by the use of gangways.

THE Hammersmith Borough Council are going to apply to the County Council for loans amounting to nearly 30,000*l.* for the King Street widening improvement and the extension of the municipal electric-light installation. The local Poor Law Guardians have a proposal before them to spend over 9,000*l.* in furnishing the new workhouse.

THE West Riding education committee have accepted a tender of 1,061*l.* for enlarging the Aston Fence Collieries Provided school, and 5,505*l.* for the erection of a new school at Bingley. A new infants' school is to be provided at Intake to accommodate 240 children and serve the township of Handsworth.

THE War Office has intimated that it does not intend to proceed with the proposed moving of the Royal Engineers from Chatham to Salisbury Plain and Aldershot, as was decided some months ago, and to hand over the Chatham Barracks to the naval authorities to accommodate seamen. The move, which would have entailed an expenditure of many thousands of pounds, was strongly opposed by the Royal Engineers and by residents and tradesmen of the locality.

THE Stafford Rural District Council have received a letter from the Local Government Board stating that on consideration of the report of their inspector they generally approve of the Council's scheme for the sewerage of the urban portions of the parishes of Castle Church and Tillington. It is proposed to join the sewers from the districts to the sewerage system of the borough, involving an outlay of 10,000*l.*



THE London and South-Western Railway experimental motor omnibus service between Haslemere and Farnham stations, on two branches of their line, has justified the permanent running of the vehicle, which is of special hill-climbing type, carrying twenty passengers, with parcels and luggage on the top. The new Hindhead golf links are conveniently reached, either from Farnham or Haslemere, by this omnibus, which passes the club-house four times daily.

AT a meeting of the Wallasey distress committee on Friday the chairman stated that seventeen applicants for employment had been registered and recommended for work at levelling sand at Harrison Park, Wallasey Village. Out of that number only 11 had turned up to the work, though they were to receive 1*l.* a week. One of the men who put in an appearance refused the work because of some class objection to the other men, and would not accept the rate of pay. It also transpired that another man on seeing the work he had to perform said he felt ill and left the job.

THE Southern District organiser of the Amalgamated Society of Engineers reports:—"We have now entered upon another year with much brighter prospects in our trade than we had at the beginning of the year just closed, and with less members signing our vacant book, both in the London district and also in most of the provincial branches in the division, London, with nearly 9,700 members, having about 2½ per cent. on donation, while in the division as a whole, with nearly 16,000 members, the per-

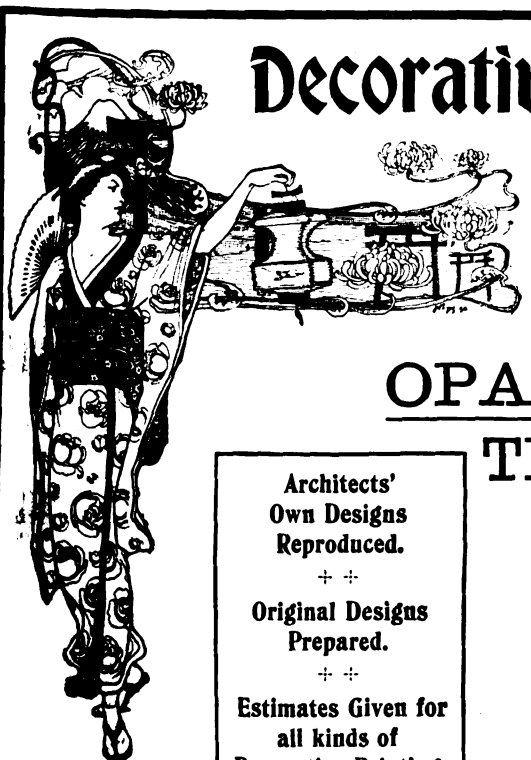
centage is about 2¼, in the eastern district of London, along with the dockyard centres and Cowes, being worst of all in this respect."

A DEPUTATION of the Staffordshire education committee has been appointed to meet the Joint Association of Pottery Manufacturers and the North Staffordshire Institute of Mining and Mechanical Engineers to ascertain as to the willingness of those bodies to accept Trentham as a centre for classes, and, in the case of the mining and mechanical engineers, as a meeting-room, and as to their readiness to give the scheme at Trentham, if adopted, the contributions and support promised by them to the proposed North Staffordshire college at Stoke.



THE Metropolitan Water Board considered on Monday a report with reference to a renewed application made by the contractors for the Rotherhithe tunnel for permission to deposit a blanket of clay 800 feet long, 40 feet wide and of a maximum depth of 5 feet, over the site of the tunnel. The committee recommended the Board to adhere to their decision of November 6 last, not to grant permission for the work. Sir John M'Dougall asked that the matter should be referred back in order that the engineers of the Board and of the London County Council might confer. It was a very serious matter indeed, not only on account of expense, but still more because of the possible risk of loss of life. The matter was referred back accordingly.

A JOINT meeting of the Grimsby Corporation finance and estates committees on Monday discussed a proposal for building new public offices. At present the officials are housed in different parts of the town. The borough surveyor submitted two schemes for bringing the whole of the departments under one roof. The schemes, which were respectively estimated to cost 26,000*l.* and 19,000*l.*, provided for a block of buildings at the corner of Doughty Road and Town Hall Square, and also involved the removal of the existing Freemen's schools. The committees appointed a sub-committee to consider other sites, while it was also decided to have a conference with the Freemen to see if the expense of removing and rebuilding their schools could not be obviated.

THE Brighton Corporation are considering the following motion:—"That when it is deemed necessary by any committee to perform any additional work to a contract or to exceed the limit of any loan sanctioned by the Local Government Board, the particulars of such requirement be first submitted to the Council for its approval, and the sanction of the Local Government Board be obtained thereto previous to the work being commenced; and in all cases where loans are duly sanctioned that instructions be given to the surveyor or other officer of the Corporation who may be responsible for the superintendence of the work, to submit to the committee concerned from time to time a statement showing the amounts previously paid and to become payable, before issuing any certificates direct to the contractor."

AT a meeting of the Newark Rural Council on Tuesday letters were read respecting the proceedings threatened by the Continuous Aerated Filter Co., Ltd., in respect of the filters used at the Balderton sewage works, which, it was alleged, were an infringement of their patent. Mr. H. Walker, engineer to the Balderton scheme, reported that he had been to a meeting of various councils threatened by the same company, and there was a decided opinion that no infringement had occurred in any of the systems, although aeration was common to all sewage treatment at the present day. In order to test the matter each authority represented at the conference, some thirty-five in all, was asked to subscribe 5*l.* 5*s.* to take expert counsel opinion in patent law and fight the case. Newark decided to contribute its quota.

IN December, Hull 6th branch of the Amalgamated Society of Carpenters and Joiners suggested to the Executive Council that the organisation should not be represented at future Trade Union Congresses. This month five branches—Partick, Wavertree, Rotherham, Fulham 1st and Hull 1st—endorse the proposal. The Partick communication says that "the overthrow of the present capitalistic system of production for profit can only be brought about by the presence inside the House of Commons of an independent Labour party, and not by cap-in-hand deputations." Wavertree expresses the opinion that Congress has "outlived its usefulness;" Fulham, that it is "an obsolete institution, and entirely unsuited to the needs of the present time;" and Hull, that membership is "a useless expense to the Society."

BUILDERS' EXCHANGE, BIRMINGHAM.

A SERIES of lectures will be delivered in the Exchange Hall at 6 P.M. on Thursday evenings, February 1 and 15 and March 1, 15 and 29.

February 1, "The Underground Slate Quarries of North Wales," by Mr. H. Browning Button. Chairman, Mr. W. Sapcote, president of the Advisory Council.

February 15, "The Housing Problem," by Mr. F. G. Whittall, president of the Midland Centre of the National Federation of Building Trade Employers. Chairman, Mr. John B. Whitehouse, president of Birmingham Master Builders' Association.

March 1, "Architectural Ceramics," by Mr. J. Miller Carr. Chairman, Mr. W. Doubleday, architect.

March 15, "Talks on Canadian Cities," by Mr. Peter B. Ball, resident agent for the Commercial Agency of the Government of Canada. Chairman, Lieutenant-Colonel J. Barnsley, J.P.

March 29, "The Goldfields of the City," by Mr. W. Francis Goodrich, an authority on the disposal of waste. Chairman, Mr. William J. Spurrier.

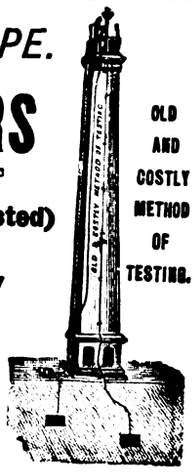
THE chief officer of the Glasgow Fire Brigade, in his annual report, states that defective building construction is still the main cause of fires in the city, 265, or 37·75 per cent. of the total being due to this cause alone; 17, or 6·4 per cent. of the defects occurred in buildings erected since the passing of the Building Regulations Act, 1892.

THE estimated expenditure of the various committees of the Liverpool City Council for the current municipal year is as follows:—The parks and gardens committee on ordinary account, 27,996*l.* 10*s.* Estate: Capital, 141,680*l.*; and ordinary, 1,756*l.* Watch: On account of fire police, 18,893*l.* Health: Ordinary, 231,479*l.*; extraordinary, on account of paving and sewerage works, 107,408*l.*; and general charges on capital account, 27,300*l.* Library, museums and arts committee, on museums account, 6,340*l.*; and 3,500*l.* capital account. Housing: 400*l.* on ordinary account and 9,250*l.* on capital account. Port sanitary and hospitals: 57,748*l.* 16*s.* 8*d.* ordinary, and 28,007*l.* 15*s.* 2*d.* capital. Lighting, 51,808*l.*

PHŒNIX FIRE INSURANCE COMPANY'S NEW OFFICE, SOUTH PARADE, LEEDS.

IN 1903 the Phœnix Insurance Company purchased a valuable site in South Parade, Leeds, for their proposed new offices from the trustees of the Young Men's Christian Association, who required larger quarters, and had outgrown the limits of the old property. The old building was pulled down and a new building has been erected by the Phœnix Company, which not only gives accommodation for their own use, but also provides several suites of offices for letting-off purposes. The new block faces South Parade and its back elevation faces Bedford Street. In addition to the basement it rises to a height of four storeys and is crowned with a Mansard roof.

The suite of offices occupied by the Phœnix Company is situated on the ground floor of the front block, and comprises a large general office, size, 28 feet 6 inches by 23 feet 6 inches; secretary's private office, 14 feet by 12 feet; and typewriters' office, size, 15 feet 6 inches by 12 feet. The remainder of the building in the front and back blocks is planned to accommodate ten suites of offices with all requisite lavatory accommodation, fitted up with the most recent type of sanitary fittings.



The front elevation and return side is faced with finely-bosted stone from the Cullingworth quarries, the eastern side opposite the Baptist chapel with white glazed brickwork, and the back elevation fronting to Bedford Street with best red pressed brick. The roof is covered with light green slates from the Tilberthwaite quarries. Glazed brickwork and tiles have been used largely in the interior of the new buildings, the former supplied by the Leeds Fireclay Company and the latter by Mr. Alfred Whitehead, of Prudential Buildings, Leeds. The whole of the walls of the Phœnix suite of offices are lined with a deep tone of ivory white tiles, and all corridors and staircases are provided with celadon green-glazed tiled dados 5 feet high. In addition to a wide staircase of concrete steps of the Granolithic Company's make, a passenger lift of Messrs. Waygood & Co.'s make gives access to the various floors of the building.

The contractors for the building are as follows:—Base-

ment works, Messrs. Chas. Myers & Sons, Woodhouse Street, Leeds; mason, brick, carpenter and joiner, Messrs. H. Atkinson & Sons, Leeds; plumber and glazier, Thos. Story & Co., Cookridge Street, Leeds; plasterer, T. Moore, Leeds; iron and steel, Leonard Cooper, Leeds; slater, J. Season, Hunslet, Leeds; painter, Fred Jackson & Co., Park Row, Leeds; electric light, John Collier & Co., Manchester. The wood and stone carving have been executed by Messrs. Smithson & Wallis, of Wade Lane, Leeds. The iron palisading and grille over front entrance by Mr. Nelson Dawson, of Chiswick Mall. Bronze cartouches, electric-light fittings, &c., by the Bromsgrove Guild of Handicraft. Stained and leaded glass by Messrs. Pope & Co., of Leeds, and plaster enrichments of ceilings by Mr. G. P. Bankart. The heating system by Messrs. W. Richardson & Co., of Darlington.

The fittings and furniture in the Phœnix suite of rooms have been specially designed by the architect. They are carried out in polished teak and stained and polished Kauri pine, and have been executed by Messrs. T. Horsman & Co., of Mark Lane, Leeds. Messrs. Elgood & Co., Leicester, supplied the locks and ironmongery. The new building, which is in the Renaissance style of architecture, has been carried out from the designs and under the superintendence of Mr. William H. Thorp, F.R.I.B.A., of Phœnix Chambers, South Parade, Leeds. Mr. W. H. Tarran has been the clerk of works. The total cost of the structure, inclusive of fitting but exclusive of site, will amount to upwards of 11,000*l.*

A BUILDER ON TARIFF REFORM.

THE subject of Tariff Reform was discussed before a large audience at the Dorking Public Hall. The chair was taken by Mr. J. Howard Colls, who said it was an absorbing topic, one which at this election must take a foremost place as that of finding some means of giving work to the unemployed. While the question was of intense interest to the middle classes and the well-to-do, it was one of life and death to the working men. He did not speak as a theorist who had had no experience of the working classes. It was a matter of intense moment why at this time, especially in his own trade, things were in such a terribly depressed condition. A great many people regarded Board of Trade statistics with great complacency, but they were not acquainted as he was with the fact that whole trades were going away from this country through foreign competition. Having mentioned that Mr. Chamberlain had asked him to become a member of the Tariff Reform Commission, Mr. Colls said that he was a builder, and he looked upon his trade as employing by far the greatest number in the aggregate of employés. It was an index to all other trades. If other trades were bad, the first thing that was done was to stop building, and so they saw huge masses thrown out of work simply because trade was bad. Mr. Colls spoke of the enormous amount of foreign joinery brought into this country, and, in pointing out in what way Tariff Reform would assist the working man, said there was no idea of putting a tax on anything we could not make ourselves. Duty would be small on things which needed very little labour to produce them, and large on things which needed a vast amount of labour. He hoped working men would forget both side issues, think of their own condition and see whether there could not be some means to protect their own industries. He had no fear of the results of this agitation in favour of Tariff Reform. Sooner or later it would be successful. Whether it would be successful at this election they did not know, but they did know pretty well that as far as Surrey was concerned it would be successful. He hoped the working men of this country would see that their salvation lay in adopting a principle such as had been suggested, and that they would vote for those who were willing to try it.

TRAMWAYS IN PERSIA.

A REPORT by M. Maulion, Councillor of Foreign Trade, attached to the French Consulate at Teheran, says:—There is at the present time only one railway in Persia, a single line railway, between Teheran and the mosque of Shah-Abd-Ul-Azim, a distance of about 10 kilometres. This is said to be a most flourishing undertaking, thanks to the weekly pilgrimage made to the mosque by the devout among the inhabitants of the capital. M. Maulion is of

opinion that there is a good opening for other local railways of this nature, more especially for one between Teheran and the village of Shimran, about 12 kilometres from the capital; this is a favourite resort of the inhabitants of Teheran during the summer heats. The line would run through a level country, and should not prove difficult of construction. Projects for this undertaking have been put forward several times, but these have fallen through owing to lack of capital and the dearth of suitable engineers. No steps can be taken towards the construction of railways on a large scale, as the concession for these has long been in the hands of Russia; no attempt appears likely to be made at present to utilise the concession. For the past ten years the main arteries of Teheran have been traversed by a tramway. At the outset this enterprise barely paid its way, but now fairly satisfactory profits are shown. There is, however, much room for development in this direction. The Teheran Tramways Company also run a telephone service in the city; very little use is made of this by merchants and offices, and the service does not pay its way. M. Maulion is, however, convinced that an efficient telephone system linking up the principal towns in Persia would meet a long-felt want. The concession for the construction of such a system was granted in May 1904 to Moayer el Mamaleck, a Persian subject, who disposed of it to the Russian Discount Bank. The Persian Government have contested the legality of the sale of the concession to the Bank; matters are now at a deadlock, and some time must inevitably elapse before any attempt is made to initiate the system. An electric-lighting station is in course of construction in the very centre of Teheran—an unfavourable situation, in the opinion of M. Maulion, being far from any coal mines and any sources of water supply. Two or three years must elapse before light can be distributed from this station. The concession is in the hands of Hadji Houssein Agha Emin Zarb, a wealthy Persian merchant. Five years ago only one printing establishment existed in Teheran, equipped with the most primitive appliances and barely paying its expenses. Recently, however, three new printing works have been opened in quick succession, fitted with modern machinery and each employing about thirty hands. These do a fairly good business, and it would appear that there is a possibility of still further development in this direction. This, with the addition of two telegraph systems (controlled respectively by the Persian Government and the Indo-European Telegraph Company), completes the roll of industrial enterprises in Teheran—a meagre list for a city of 300,000 inhabitants.

HEAT LOSSES FROM BUILDINGS.*

OUR chief need at the present time is a more accurate knowledge of the amount of heat lost from a room, and I have myself formed the opinion from considerable experience that it can only be roughly calculated from existing data, and that the chief element of uncertainty is the amount of heat passing away by irregular ventilation, and it is to this point that attention is required.

I laid a proposition before the Council some years ago that this Institution should find the funds for undertaking tests of this character for the general benefit, but I did not at that time appreciate fully the condition of the banking account of this Institution. I wished the Institution to supply the apparatus and the instructions, and commission a number of competent members to supply the information taken from a large number of rooms in various parts of the country, so that the information could be collected and analysed. That proposition fell to the ground owing to lack of funds, but I certainly think that the wealthier members of this Institution might subscribe to a small fund for this purpose, for only a small fund would be necessary. I have no doubt that the information secured would be extremely valuable.

I shall now give an outline of calorimetric methods of testing buildings, which I think can be usefully employed and which will obviate all the discrepancies and inconsistencies. These are methods which I have employed myself, and I believe them to be both scientific and practical.

They are not methods which are by any means easy to carry out, but I think they are at least as simple as any I have any knowledge of, and perhaps as simple as it is

Digitized by Google

possible for experiments of this character to be. The process is essentially a difficult one and cannot be exactly carried out without considerable trouble and some special apparatus. Assume then, for purposes of illustration, that we have a large existing drawing-room of 25,000 cubic feet, of irregular shape, with many recesses and outside walls and a roof, the character of which as regards heat transmission cannot be readily determined, and assume, further, that it is specified to be heated by radiators fixed in recesses behind a dado to 62 degs. and no more, with an outside temperature of 28 degs. when the temperature of the radiators does not exceed 140 degs. and with a large open fire at one end of the room. Now I do not doubt that to make calculations from any existing data which would enable this problem to be exactly solved would be impossible. Observe, please, that there is no single item of the calculations which can be exactly determined. Who is going to calculate the heat lost from an existing roof which may or may not be porous, or from walls the substance of which is unknown? Who can tell how many thermal units per hour may be expected to be emitted by a "large fire" at one end of the room, perhaps in what is known as a "cosy corner?" Who is going to prophecy exactly how much heat may be expected from radiators fixed in a recess and behind a dado?

I think I should be safe in saying that the great majority of heating engineers would solve the problem by fixing vastly more surface than could, in their opinion, possibly be required and trusting to luck.

Now I think the method which I shall presently explain would solve the problem exactly and in as simple a manner as it could be solved.

In the first place, a rough estimate should be made of the number of thermal units per hour that would be needed.

I do not think it would be probable that a room of this character should require more than 100,000 B.T.U. per hour to maintain it at 62 degs. Now a pound of ordinary petroleum by complete combustion gives off about 22,000 B.T.U. per hour. I should provide, therefore, half a dozen specially designed petroleum stoves and a plentiful supply of petroleum, a sample of which I should test carefully with a calorimeter and ascertain its exact thermal value. The stoves should each be placed under a large piece of thin sheet-iron fixed horizontally for distributing the hot gases from the stove.

The experiment should be made on the worst day that could be selected, as near as possible to the conditions of the specification, a large fire being maintained in the grate and all other factors kept in the same state as they might be expected to be when the room was in actual use under severe conditions. I should then place the stoves as near as possible in the position which the radiator would occupy and carefully weigh into each a certain quantity of petroleum and light them all, hanging thermometers all over the room. These stoves and the fire should be kept alight day and night for at least twenty-four hours, careful observations being made of the thermometers during the whole period. If any thermometer read higher than it ought to the stoves in its vicinity should be turned down, and if any read lower the corresponding stoves should be turned up. They should be continuously adjusted until an even and constant temperature of 62 degs. was secured all over the room. Meanwhile, the amount of petroleum burnt per hour in each stove should be carefully observed. This value, multiplied by the thermal value of the petroleum would give the number of B.T.U. required at each point under working conditions. This is the first part of the investigation.

The second would consist in the determination of the sizes of the radiators which when fixed in the manner required would give in each case the required number of B.T.U. This investigation might be carried out at the works.

To do this a radiator should be mounted in exactly the manner that the radiators in the finished job would be mounted. Two tanks should then be fixed in its vicinity at different levels. Under the bottom one would be fixed a petroleum stove or a steam pipe or other means of heating the contents of the bottom tank to any desired degree, with a pump for forcing the water from the bottom to the top. The water in the bottom tank should then be heated to say 5 degs. above the required temperature and pumped up into the top tank. The water from the top tank should then be allowed to flow by a pipe from the top tank into the radiator and from the radiator into the bottom tank, the

Are you interested in WOOD PRESERVATION?

Apply to the **ANTHROL** Company, Kinning Park, Glasgow, and you will receive an interesting booklet on the subject, which gives a full account of the remarkable properties of **ANTHROL** and describes the very simple and inexpensive methods by which it is applied. It is an antiseptic preparation which protects any kind of wood impregnated with it from decay in both damp and dry situations, and from the ravages of all wood-destroying organisms in either temperate or tropical climates.

ANTHROL

The result of much practical experiment has shown it to be the **most** efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time **greatly** improves the appearance of wood, and may be varnished or painted if desired.

The **ANTHROL** COMPANY, Kinning Park, GLASGOW; and 6 Crosby Square, LONDON

Digitized by Google

pipe being provided with a valve so that it could be adjusted to any required flow. Then the valve should be adjusted until the water in the return pipe was as much below the required temperature of the radiator as the water in the tank is above that temperature, temperatures being taken at inlet and outlet of the radiator.

The weight of water in pounds flowing per hour through the radiator multiplied by the number of degrees difference between the flow and return pipe would then give the number of B.T.U. per hour given off by the radiator. A certain part, however, of this heat would be lost from the wall at the back of the radiator. This amount can be estimated with sufficient accuracy from the conductivity of the wall. As the total amount is not large, an ample margin might be allowed on this account. All other heat emitted from the radiator must escape into the room.

The size of radiator therefore necessary to give the amount of heat required can be determined with some approach to accuracy.

This method will apply in a large number of cases. For instance, suppose complaint is made that a certain room already provided with radiators does not get sufficiently hot. It is required to determine whether larger radiators are to be provided or whether an increase in temperature in the existing radiators will be sufficient to secure the desired result. It is easy to determine by the methods I have suggested how many additional B.T.U. are required.

For instance, suppose a room of 4,500 cubic feet has two radiators, each of 30 square feet, and that the ordinary maximum temperature of these radiators is 150 degs., producing in the room a temperature of 53 degs. where 60 degs. is the desired temperature. By the method explained it would be a comparatively easy matter to determine that, say, an additional 3,500 B.T.U. per hour were required. Thus to secure the result each radiator would be required to furnish an additional 1,800 B.T.U. per hour.

It will be seen that each radiator at present would be giving off about $128 \times 30 = 3,840$ B.T.U., while they would each give off 5,640 B.T.U. (the required excess) at a temperature of 178 degs.

It would thus be seen that what is required is to increase the circulation to the radiators or to increase the boiler power (as the case may be) so that a temperature of 178 degs. is maintained in the radiators. If this cannot be done then larger radiators must be provided.

I have not time to deal more fully with the question of circulation to the radiators so as to secure any desired temperature.

So much for the heating. I will now suggest analogous methods whereby similar tests could be made for ventilation.

Let us consider the case of a large hall which it is specified that 1,000 persons are to occupy without an increase in CO_2 beyond, let us say, 8 parts in 10,000. The ordinary method of calculation would give the amount of air that should theoretically be supplied. Let us assume that the apparatus has been installed and it is required to test its efficacy before the hall is in actual use, so that any necessary alterations can be undertaken in time.

Now every adult exhales about 0.7 cubic feet of CO_2 per hour. As there are 8 cubic feet of CO_2 in 1 lb. weight of the gas, it is clear that eleven adults exhale approximately 1 lb. of CO_2 in one hour; therefore 1,000 human beings will altogether exhale 90 lbs. of CO_2 per hour. Hence if we procure, say, 180 lbs. of liquid CO_2 and arrange to release it at a regular rate in the hall and distribute it all over the whole area while the apparatus is working, any of the standard methods of analysis of the air would then determine the amount of CO_2, and if this were found in excess at the end of a two hours' run it would be clear that the requirements were not fulfilled, and a little elementary calculation would show to what extent it would be necessary to increase the ventilation to secure the desired result.

I have no time to elaborate these suggestions. These methods of testing appear to me to give much more direct and reliable results than can be secured from calculations based on such unsatisfactory data as we are able to obtain from text-books or laboratory tests.

The object in all such tests it seems to me is to reproduce working conditions and to arrange the important variable of which it is required to ascertain the value in such a way that (i) it can be varied at will, and (ii) measured while it is actually doing the work it will be called upon to do. Such direct and primary tests are much more convincing and satisfactory than any elaborate system of indirect and secondary tests and calculations.

ARCHITECTS AND BUILDERS PLEASE NOTE.

CALL AND SEE THE PATENT "GASCOL" STOVE.

The special attention of all Architects and Builders is called to the "GASCOL" patent stove, which is a self-setting stove, which can be heated by either gas or coal, or both at once, effecting a great saving when a small fire is required for warming purposes.

Some Striking Advantages of the "GASCOL."

The "GASCOL" patent stove is constructed on scientific principles, and is exceedingly economical in use, the Oven, with tap full on, consuming but 10 feet of gas per hour. It is strongly built and the fittings are of the best quality. The change can be made in a moment from coal to gas, or *vice versa*. The Gas Hot Plate is fitted with one Boiling Burner, one Simmering Burner, and one Combination Griller and Boiling Burner, with Rise and Fall Double Deflectors, along with a strong tinned Grill Pan and Grid. The Oven is fitted with two Burners, two Runners, one Grid Shelf, and one Browning Sheet, all of which are detachable, and can be easily removed for cleaning. The Gas Connection can be made either at back or front of the Range. The "GASCOL" is simple in action, automatic in working, and is the ideal cooking stove for villas, flats, &c. It is, moreover, exceedingly moderate in price. All Architects and Builders are requested to call and see the "GASCOL" at any of the leading Wholesale Ironmongers, or it may be seen in operation at the showrooms of

THE DAVIS GAS STOVE COMPANY, LTD., 59 Queen Victoria Street

Architects' Benevolent Society.

This Society, founded in 1850, is the only Institution in the United Kingdom specially organised to assist Architects, Architects' Assistants, or their widows and orphans. During its existence the Society has been instrumental in alleviating the distress of many hundreds of cases. Yet not more than one per cent. of architects in active practice contribute to its support. To meet the demands of deserving applicants fresh annual subscriptions are urgently needed.

In response to the President's recent appeal on behalf of the Society, Mr. Walter Emden has offered to contribute £50, if nine other gentlemen will contribute a similar sum.

In addition to forming one of the nine contributors, Mr. William Glover has promised a second donation of £50, if a further £450 is contributed before Christmas.

Contributions will be gratefully received by the undersigned,

W. HILTON NASH, Hon. Treasurer.
PERCIVALL CURREY, Hon. Secretary.

COOLEY'S PATENT

DOUBLE DOWEL-PINS.

By this system each Block is securely fastened to its neighbour, and by means of the double-grip of each Pin it is absolutely impossible for the Blocks to loosen; hence it can be recommended in all places where the traffic is heavy, such as in Factories, Schools, Public Halls and Sheds, &c.

For **Wood-Paving** purposes this system will considerably increase the life of the road by reason of the formation of a solid mass, which counteracts the destroying effects of *vibration*.

Art Plates from "The Architect."

AWARDED GOLD MEDALS, INTERNATIONAL HEALTH EXHIBITION AND ARCHITECTURAL AND BUILDING TRADES EXHIBITION (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for framing.

The Corn Field.—(1) Ploughing; (2) Harrowing; (3) Mowing; (4) Carting; (5) The Products of the Corn Field.

In Five Separate Plates. Total Length, 14 ft. 7 in. by 15 in. deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT," in 1886. A few proofs were taken which immediately became out of print.

OPINIONS OF THE PRESS.—"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition has been issued."—*The Lady's Pictorial.* "They are beautifully done in colours by the permanent ink-photo process and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage.* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour work in permanent ink photo by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic and would grace the walls of any house."—*The Gentlewoman.* AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates they have been reproduced by Subscription at Half a Guinea the Set, free by post, carefully packed inside patent roller, and are now ready for issuing. Immediate application is requested. May be had framed in Black Reeded Frame with Gold Mounts, price Three Guineas the Set of Five Pieces.

Galatea.

From the Painting by RAPHAEL in the Villa Farnesina, Rome. Size 30 in. by 22 in. Price Two Shillings. Free by post, carefully packed inside patent roller.

St. George.

From the Painting by RAPHAEL, in the Louvre. Size 15 in. by 20 in. Price One Shilling and Sixpence. Free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

AWARDED SILVER MEDAL, SANITARY INSTITUTE, 1902.

THE BRITISH SANITARY CO.'S NEW AND IMPROVED SELF-ACTING EARTH CLOSET.

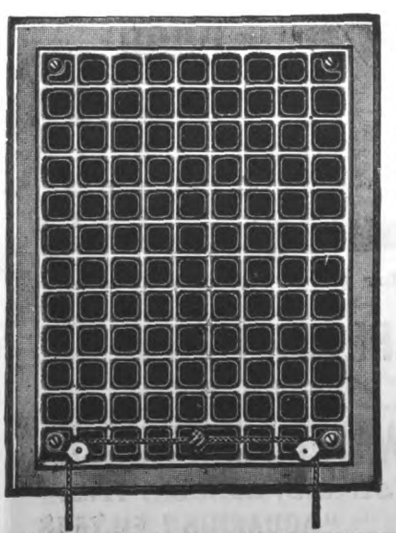
HIGHEST AWARDS:

Birkenhead, 1881; Newcastle-on-Tyne, 1882; Glasgow, 1883; Dublin, 1884; Plymouth, 1885; Edinburgh, 1886; Glasgow, 1887; Haddington, 1892; Liverpool, 1894; Newcastle-on-Tyne, 1896.

For Simplicity and Efficiency their Closet stands alone.

Medal from the Society of Architects, London, for superiority of workmanship and materials used in manufacture of Closets.

ITS ADVANTAGES ARE:—



1ST. The simplicity, strength of the mechanism, and non-liability to get out of order. 2ND. It is self-acting. 3RD. The effective distribution of the deodorising material thoroughly covers and absorbs all offensive matter and smells. 4TH. The large capacity of the containing magazine holding the earth or other deodorising material. 5TH. The very moderate price it can be sold at as compared with other closets not even possessing the above advantages.

PRICE LIST AND FULL PARTICULARS SENT ON APPLICATION TO

H. & C. Wrought Steel "LOUVRE" VENTILATORS.

MADE IN 130 SIZES.

From 4 × 6 to 24 × 42.

Black Japanned,
White Japanned,
Nickel Plated,
Bronze Plated,
ALSO IN
Solid Wrought Brass
AND
Bronze Metal.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass pulley (no cord or tassels).

ELEGANCE. LOW PRICE. NO BREAKAGE.

SPECIFIED BY ARCHITECTS.

These Ventilators being made entirely of **Wrought Steel,** breakage either in transportation, in stock or in use, is practically impossible.

They are light in weight, with a consequent **Saving in Carriage.**

The Operating Slide is made of very heavy gauge steel, and is especially **strong** to insure against breakage and guaranteeing a free and positive operation.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass Pulley (no cord or tassels).

Sold by all First-class Builders' Merchants.

THE

Architect and Contract Reporter.

FRIDAY, FEBRUARY 2, 1906.

Published weekly, subscription 19s. per annum for Great Britain, and for Colonial and Foreign subscriptions £1 6s. 6d.

All business communications to the Managing Director,

P. A. GILBERT WOOD,

Publishing Offices, 6-11 Imperial Buildings, Ludgate Circus London, England.

*** *Entered in the United States of America as second-class matter. Agents for America, The International News Co., 5 Bream's Buildings, Chancery Lane, London, England, and New York.*

Important Notice to the

Architects and Civil Engineers of Westminster.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Ltd., to establish Branch Offices in that district at 43 OLD QUEEN STREET, S.W., *Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.*

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

The Birmingham Offices are at 102 COLMORE ROW.

Melbourne, Sydney, Brisbane, and Perth, Australia; Wellington, Christchurch, and Auckland, New Zealand; Launceston and Hobart, Tasmania.

SOUTH AFRICA—*Central News Agency, Ltd.*

Telephone No. 4725 Holborn.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

HOUSE NEAR CAMBRIDGE.—DRAWING-ROOM.—THE HALL.

TRADE NOTES.

THE Carron Company was founded as far back as 1759. It was not long before the reputation of the company for stoves was established. That there was a demand for them in Canada is proved by an interesting letter from Mr. W. Waller, Sunny Dale Farm, Whitewood, North-Western Territory, which was received a few days ago. He writes :—"I was on a business trip this fall in the north-east part of Saskatchewan, and saw a box stove of what I thought was a new design in box stoves. On inquiring where the man got it, he said it was his great-grandfather's, and that it was made by the Carron Company nearly 150 years ago. I thought it most extraordinary for a stove to last that length of time. The stove belongs to an early settler's family." When the hard work and wear and tear which stoves have to undergo in Canada is considered, the statement that the stove is not only in use but was taken to be "a new design" speaks well for the material and the workmanship.

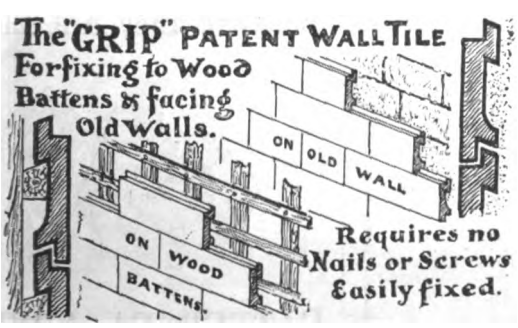
THE new infirmary, Knaresborough, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves and Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE tender of Messrs. Wright & Co., of Leicester, amounting to 41,482*l.*, has been accepted for carrying out the drainage-outfall scheme at Maidstone. The engineer's estimate was 46,064*l.*

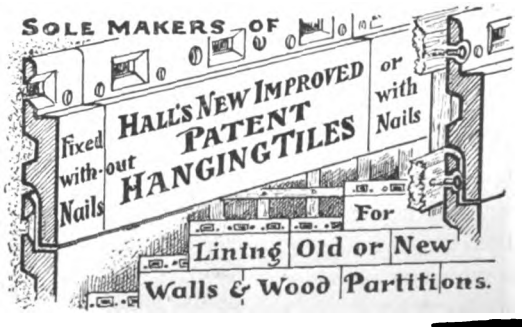
THE directors of the Southsea Clarence Pier Company will on Tuesday next seek authority at an extraordinary meeting to accept the tender of Robert H. B. Neal, Ltd., for the improvement of the pier, amounting to 10,346*l.*

MESSRS. THOMAS PIGGOTT & Co., makers of pipes, tanks and steel structures, have recently secured orders for the following :—Twenty pressed steel standard tanks for Buenos Ayres ; riveted steel chimney, 6 feet diameter by 125 feet high ; pithead frame, for South Wales ; pressed culvert pipes, 36 inches diameter, for South Africa ; riveted rectangular flues, for Newcastle Power Station.

MESSRS. ARTHUR L. GIBSON & Co. have recently obtained the following contracts for the supply of their patent Kinnear steel rolling shutters :—Islington Postal Stores, twenty-four Kinnear patent steel rolling shutters ; Northern District Post Office, Islington, four Kinnear steel rolling shutters ; Underground Electric Railways of London, Ltd., Lillie Bridge car sheds, six Kinnear steel rolling shutters ; London County Council, Jews Row, Wandsworth, car shed, two Kinnear steel rolling shutters ; London County Council, Battersea Sub-Station, one Kinnear steel rolling shutter.



WE have been requested to announce that Maughan's Patent Geyser Company, Ltd. (the original makers of geysers), have been compelled, owing to the need of all available space at their factory in Holywell Row, Finsbury, to open showrooms and offices at 58 Finsbury Pavement, E.C., where they have on show a complete range of their new patterns of geysers, gas and oil stoves, boilers, water heaters, baths, &c. The showrooms are most conveniently situated at the tramway terminus and close to Moorgate Street stations. Maughan's patent geysers have been long before the public, and are now being extensively adopted as a simple and convenient form of supply for hot water, absolutely without risk. The advantages of a properly and substantially made geyser are so obvious in many cases that an inspection of this useful invention is almost a necessity.



IN Johannesburg during the month of December 138 dwellings were erected, 54 additions to buildings, 184 rooms, 88 stores, shops and offices, and 132 buildings of other descriptions, at an estimated cost of 320,102*l.*

GREENOCK CORPORATION law and finance committee at a meeting on Monday agreed to erect a refuse-destructor, the scheme to include electric plant for generating power. The cost is estimated at from 15,000*l.* to 16,000*l.*

VARIETIES.

THE Durham County Council have submitted sketch plans of a nurses' block, to be erected at the asylum, to the Lunacy Commissioners. The estimated total cost is 7,000*l.*

THE Panama Canal Commission has reported in favour of the lock canal system for the canal across the isthmus. They recommend that it shall be built at a level of 85 feet.

THE Royal Sanitary Institute will hold a discussion on the 14th inst. on the question, "Is the Intercepting Trap a Failure?" which will be opened by Mr. R. Read, city surveyor, Gloucester, and Dr. W. Butler.

THE building trades in Shropshire are showing signs of revival, and at Church Stretton, which is becoming a favourite English spa, a considerable amount of building, both for private and public residences, is contemplated.

THE Dundee water committee have approved the plans and sections for the new filter beds for Dundee water at Gagie prepared by Mr. Baxter, the engineer. Instructions were given to take in tenders for the work, which is estimated to cost about 10,000*l.*

THE Borough of Croydon have been polled on the proposal of the Corporation to expend 250,000*l.* on a new water scheme. Though adopted by the Council with only one dissentient vote, the burgesses rejected the scheme by 6,450 votes to 1,351.

THE Glasgow and South-Western Railway Company have accepted the offer of Messrs. Symington & Sons, contractors, Coatbridge, to carry out the doubling of railway line at Elderslie. This work includes a new station at Elderslie, double island platform, and an additional bridge over the turnpike road.

MR. W. RIDLEY MAKEPEACE has resigned his position as secretary of Messrs. Head, Wrightson & Co., Ltd., and accepted the appointment of general commercial manager of Messrs. John Abbot & Co., Ltd., Gateshead-on-Tyne, from February 1. Mr. Makepeace was sixteen years with Messrs. John Abbot & Co., Ltd., before coming to Stockton-on-Tees in 1890.

IN accordance with the decision of the City Council, a ballot of the ratepayers is to be taken on the question of approving the Manchester Corporation Bill, 1906, which was rejected by a town's meeting. The date of the polling has been fixed for February 8 next. The voting demands a great deal of preparation, and the whole cost will be considerable. There will be no fewer than 236 polling stations.

THE President of the Board of Trade will on the 16th inst. receive a deputation of trade union leaders, who will bring before him the question of the housing of the people. It is intended to ask the President to give such effect to the recommendations of the Select Committee on the amendment of the Cheap Trains Act as will lead to the provision of cheaper and better services of workmen's trains on various railways.

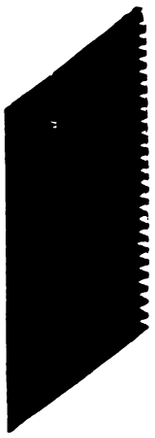
THE First Lord of the Admiralty and the Postmaster-General have expressed their willingness to receive, some time soon after the opening of Parliament, a deputation of trade union leaders to consider the alleged placing of Government contracts with firms whose conditions of labour are contrary to the letter and spirit of the fair wages resolution of the House of Commons of 1891.

THE British Consul at Buenos Ayres states that "bricklayers and carpenters do just as they please about working or resting, and contractors are very chary of binding themselves under contract." A large amount of building is going on in Buenos Ayres on account of private individuals, and it is improbable that the projected municipal works will be undertaken in the near future.

A NEW cooking range has been adopted for military kitchens. The new stove is built in the centre of the cookhouse, and is lighted by a single fire. Boiling, baking, steaming, frying, &c., can be carried on simultaneously, and each part of the range is made accessible by small separate doors. The heat at any section can be regulated, and steam vapour is conducted away by pipes. A minimum of labour is required to work the range, and comparatively little coal is used.

THE Holborn Borough Council have agreed to contribute 4,000*l.*, subject to the Duke of Bedford contributing the sum of 2,000*l.*, towards the expenses of paving, &c., and allowing for the use of the old materials of the demolished houses for levelling purposes, in a scheme for an improvement of the Bedford estate which involves the closing of Torrington Mews, the widening of Keppel Mews North, the construc

"MAXIMUM LIGHT GLASS."



LENSES AND PRISMS COMBINED IN ONE SHEET.

ABSOLUTELY THE BEST FOR DAY-LIGHTING DARK INTERIORS.

Increases the Daylight from 5 to 20 times.

By reason of a lens surface running vertically on the outside and at right angles to an interior prismatic surface, this glass possesses a double refractory power.

All the light from the sky is gathered, projected, and completely diffused.

The use of the "Maximum Light Glass" lessens the cost of artificial lighting.

Supplied in ordinary window-glass sizes.

Also in ornamental designs in lead or copper.

tion of a new street on the site of Keppel Mews South, and the widening of Torrington Place, from Torrington Mews westward, from 50 feet to 60 feet.

THE West Riding County Council have decided that the West Riding asylums committee be empowered to erect the acute blocks (Nos. 1 and 2), the epileptic blocks (Nos. 1 and 2), for the accommodation of 600 cases (300 male and 300 female), at Storthes Hall, and carry out the other works incidental thercto, in accordance with the plans approved by the Lunacy Commissioners and Home Secretary, and submitted to the County Council, at an estimated cost of 93,800*l.* The architect's estimate works out at the sum of 156*l.* 6*s.* 8*d.* per bed. The work is to be undertaken as soon as possible.

THE Bootle education committee, at their monthly meeting, decided to select sites for new schools as follows:—(*a*) South of Breeze Hill, for a school for about 750 children; (*b*) on land near where the extension of Fernhill Road will cross the Midland Railway cutting, for 1,000 children; (*c*) in Orrell, north of the district known as Klondyke, for 1,000 children; (*d*) in Orrell, in the vicinity of Orrell village, for 1,000 children; (*e*) east of Derby Park, for 1,000 children; and (*f*) on land still further north, for 1,000 children. When the sites are obtained the building operations will be considered.

THE new ward pavilion of the Glasgow Victoria infirmary was opened on the 13th ult. The general wards are 74 feet long and 26 feet wide, and accommodate on each of the four floors eighteen beds. In addition there is a small ward with single beds. There will be a total of seventy-six extra beds. Sixteen additional bedrooms for servants have been provided in the roof of the ward pavilion. An extension has been made to the nurses' home, thirty-seven bedrooms and six parlours being added. The new buildings were erected according to plans prepared by Mr. H. E. Clifford, 225 St. Vincent Street.

AT the Indian Industrial Conference, inaugurated at Benares on December 30, resolutions were passed urging the Governments and Administrations in India, as also the people, according to their powers and opportunities, to found technical schools in large centres for the industrial education of the people, and to foster and extend the use of Indian manufactures in the country in preference to foreign goods. It was also agreed to urge that Government and private schools and colleges should, where practicable, have industrial classes added to them.

A FIRE at the Clarence Gardens Hotel, Scarborough, on Sunday, was extinguished in a remarkable manner. The landlord was surprised on going into the vaults to find the place saturated with water and traces of fire. Examination showed that a dropped light had caused the sawdust to burst into flames. The fire spread to the counter, but the heat under the counter melted a leaden water-pipe in such a manner as to cause the water to issue in the form of spray. The fire was thus arrested, and comparatively slight damage was done. That the heat was great, however, is shown by the fact that a painted door a good distance from the counter was blistered.

THE *Pioneer* gives particulars of the new bridge across the Ganges at Allahabad, which was opened on December 20, and which has been named the Curzon Bridge, in accordance with the custom by which the name of the Viceroy is bestowed upon the most important bridge constructed during his term of office. The river here is 6,000 feet wide, but this was reduced to 3,000 feet by a training bund 4,000 feet long formed of sand from the river bed faced with loose stones. The bridge has fifteen spans of 200 feet each, and cost a quarter of a million sterling. The piers are sunk 100 feet below low-water level, and the railings are 100 feet above.

THE annual trade returns of the Middlesbrough Chamber of Commerce show that 1,760,294 tons of iron ore were imported last year, this being a record. The make of Cleveland and hematite pig-iron in the Middlesbrough district amounted to 2,115,000 tons, and was the largest since 1900. The stocks in Connal's warrant stores at the end of the year amounted to 707,343 tons, and was the largest on record at Middlesbrough. Compared with twelve months ago the increase was 515,515 tons. The value of oversea shipments of all goods except coal and coke was 4,762,557*l.*, this being the largest since 1900, when the value was 6,318,282*l.*

CONSUL-GENERAL GUENTHER, of Frankfort, reports on the condition of the labour market in Germany during last year,

"SANALENE"

as compared with 1904, as follows:—"While in 1904 there were 130.9 applicants for each 100 vacancies, the number in October 1905 was only 112.2. The favourable condition of the labour market in the great industrial centres is mainly due to the marked improvement in the iron and steel and in the metal and machinery branches. The building trade continues to be well employed, which was not the case in 1904 at this time. In many places there was even a lack of workmen in the building branch. A strong demand for unskilled labour was especially noticeable at Hamburg, Berlin, Charlottenburg, Leipzig, Ludwigshafen, &c., and although the wages ruled high many foreigners had to be employed."

The scheme for extending the isolation hospital at Dialstone Lane, Stockport, is to be gone on with to the extent of adding a block to accommodate eight beds in about five or six separate wards. The object of this new block is to isolate all doubtful cases when admitted to the hospital. Nine sets of plans were sent in on the invitation of the hospital sub-committee. Dr. E. Sergeant, the medical officer of health to the Lancashire County Council, was the assessor, and he awarded the first premium to Mr. Geoff. H. Brady, Stockport; second premium, with 10*l.*, to Mr. C. A. Locke, Stockport; and third premium, with 5*l.*, to Mr. A. G. Wilkinson, St. Petersgate, Stockport. The health committee this week accepted Mr. Brady's plans. It is estimated that the extension will cost about 2,000*l.*

The parks committee of Glasgow Corporation recommend the purchase of the estate of Yorkhill in order that the greater part of it may be laid out as a public park. The estate, which includes the mansion-house of Yorkhill, consists of 31½ acres, and the price asked is 60,000*l.* To meet this expenditure it is proposed to feu the Bunhouse grounds, consisting of 6½ acres, which were acquired in 1895 at a cost of 30,000*l.* These grounds were utilised for the machinery section of the International Exhibition of 1901. It is estimated that the feuing of the Bunhouse grounds will realise 50,000*l.*, and it is also proposed to feu 10 acres of Yorkhill estate, by which it is expected to realise an additional sum of 35,000*l.*, being 85,000*l.* in all, or 25,000*l.* in excess of the purchase price of Yorkhill, and leaving 21½ acres available for the public park.

The Western District committee of the County Council of Dumbarton are presently extending the sewerage of Alexandria, a community which drains into the river Leven, and the Colquhoun trustees, who own the salmon fishings on the river, and the local angling association and their lessees jointly petitioned on the 19th ult. the Sheriff of Dumbarton for interim interdict against the works, as the local authority would give them no guarantee that the sewage would be treated before being sent into the river, and that consequently their fishing rights would be further injured by the additional pollution. For the local authority it was contended that the communities on the banks of the river had had the right, from time immemorial, of draining into the river. The Sheriff granted interim interdict as craved.

The *Diario Official*, Brazil, of December 31 publishes the text of the Budget expenditure for 1906, approved by Congress on December 30. The principal items of interest are summarised below:—The Ministry of Justice and Home Affairs is authorised to expend 500,000 milreis on the purchase of disinfecting apparatus and barges for use in ports, more especially at Pernambuco, Maranhao, Alagoas, Amazonas and Paraná; 1,000,000 milreis on the commencement of the erection of a building for the National Congress, including the purchase of the necessary land; 1,700,000 milreis on the erection of various other Government buildings and on repairs to existing buildings. The Ministry of Marine is authorised to expend 30,000 milreis on meteorological apparatus, 180,000 milreis on the purchase and erection of lighthouses, to engage for the term of three years, at the annual salary of 6,000 milreis, a first-rate oculist to serve in the Naval Hospital, to expend 20,000 milreis on the purchase of surgical instruments for the Naval Hospital, 500,000 milreis on life-saving apparatus, 670,000 milreis on the construction of submarines of national invention. The Ministry of War is authorised to expend 300,000 milreis on the reconstruction of the building in which that Ministry is housed, 50,000 milreis on the completion of the South Luiz de Caceres telegraph line. The Ministry of Industry, Ways of Communication and Public Works is authorised to expend 400,000 milreis on improving the telegraph and telephone systems of Rio de Janeiro, 340,000 milreis on the erection of telegraph lines in various States.

The President is authorised to grant special privileges, including the duty-free importation of plant, to enterprises established for the production of electricity by means of water power.

THE North Wales District Centre of the Sanitary Inspectors' Association held a sessional meeting at Colwyn Bay. The members, under the guidance of Mr. W. Jones, the engineer to the Urban Council, visited the new sewerage works, including the pumping station, which is nearly ready for the pumping machinery. It is of red brick with terra-cotta dressings. There are two halls some 100 feet in length. The first is built over a deep chamber lined with concrete, into which the sewage from the trunk main will run. On girders above this sump chamber, but below the floor level of the hall, will be placed four pumps, two of 20 inches diameter and two of 40 inches diameter, which will raise the sewage to a tank in the side of the hill, about 40 feet higher than the pumping station. The pumps will be driven by gas-engines placed in the second hall, and divided from it by a masonry partition. There is space provided for a fifth pump and a fifth engine. The two halls will be provided with travelling cranes for dealing with heavy pieces of machinery that may require repairs at the repairing shop in the buildings. In addition there are an engineer's office and a store-room. A residence for the engineer in charge has been built within the grounds. The sewage pumped into the tank will be discharged into the sea twice in each twenty-four hours, soon after the ebb of each tide commences.

BUILDING AND BUILDERS.

IN a recent case under the Workmen's Compensation Act at Stockport the measurement of a chimney-pot in the height of a building made all the difference to the result. A man was killed while working on a chimney. The height of the building to the top of the chimney was under 30 feet, but with the chimney-pot included in the measurement the height was 31 feet 1 inch. The judge awarded the widow 117*l.*

THE Johannesburg Master Builders' Association have decided to inform similar bodies in South Africa and Great Britain that there is no opening for unemployed workmen in the town. The labour market is already greatly overcrowded, and fresh applicants are continually arriving, in the belief that the abnormally high wages are due to an inadequate supply of men.

IT was stated at the meeting of the board of management of the Manchester Royal Infirmary on Monday that, with the exception of the out-patients' block, the whole of the ground floors of the new infirmary buildings at Stanley Grove are practically completed. The granite basis is also finished around the nurses' home, and the builders are waiting for the stone to carry it round the administrative and teaching blocks. The contracts for the erection of the three-storey buildings fronting Oxford Street will be let in April next. The architects are Messrs. E. T. Hall and John Brooke.

THE Lancashire education committee are applying to the Local Government Board for leave to borrow the sum of 84,721*l.* for the following purposes:—Erecting and furnishing school at Manchester Road, Droylsden, 10,396*l.*; school and cookery and manual instruction centre at Market Street, Droylsden, 12,733*l.*; new school at Litherland, 14,875*l.*; new school at Errwood Road, Levenshulme, 14,202*l.*; new school at Fleetwood, 8,280*l.*; new school of manual instruction at Royton, 11,180*l.*; new school at Ansdell, 2,625*l.*; new school at Audenshaw, 6,828*l.*; new school at Feniscowles, 3,525*l.*

ELECTRIC NOTES.

THE Light Railway Commissioners have sanctioned an extension of the electric tramways between Bath and Saltford.

FONTAINEBLEAU is to be lighted by electricity. The site for a generating station has just been secured, and the work is to be carried out as soon as possible.

IN some parts of the Leith electric system the electric lamp-pole and the pole supporting the trolley wire are close together. The Town Council have lately been considering whether one pole could not be made to serve the double purpose. Plans have been submitted to the police committee, who agreed to the proposal, with the exception of

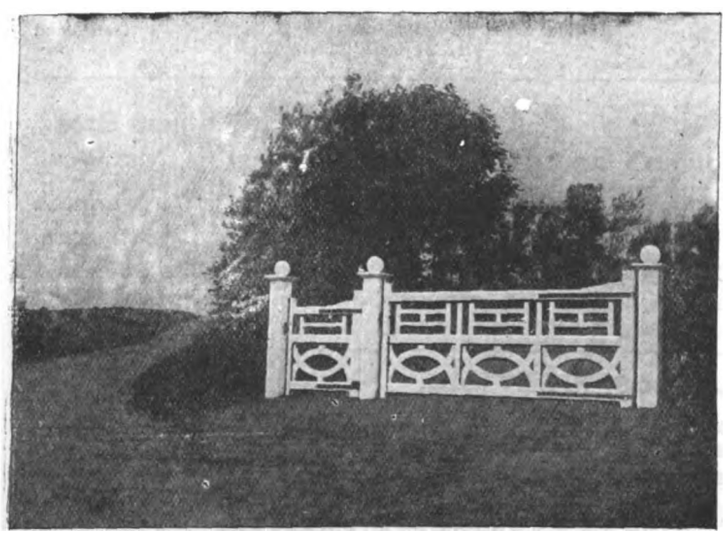
the plans for the bracket arm pillars, only one of which they agreed in the meantime to have reconstructed.

THE Todmorden Corporation have been authorised to immediately promote a Bill in Parliament empowering them to provide and run motor omnibuses within and without the borough, in connection with the tramway systems of the Corporations of Halifax, Rochdale and Burnley. This would supply the missing link of a complete service of trams or 'buses connecting Lancashire and Yorkshire, and extending from Bradford and Leeds to Manchester and Liverpool.

THE City of London Electric Lighting Company have offered to carry out at its own cost a demonstration of an improved system of electric lighting in certain streets of the City, namely, Newgate Street, Holborn, New Bridge Street, and Farringdon Street. At the present time experiments are being carried out in Fleet Street, Queen Victoria Street, and Lower Thames Street with a view to ascertaining the relative value of high-pressure incandescent gas as a street illuminant in competition with the electric current. So far the experiment has been successful in point of illuminating power and cheapness.



MR. H. R. HOOPER on the 25th ult. conducted an inquiry on behalf of the Local Government Board into an application of the Grimsby Corporation to borrow the sum of 18,000*l.* for extensions to the municipal electricity undertaking. The electrical engineer, Mr. Vignoles, stated that of the 18,000*l.* 9,500*l.* was required for extensions of plant and buildings, and 8,500*l.* for cables and mains. In the ordinary course these extensions would not have been necessary for three years, but the Corporation had entered into an agreement with the Great Central Railway Company to supply electricity to the company's docks. Additional plant was necessary in order to fulfil this agreement.

THE Caledon Shipbuilding and Engineering Company wrote to Dundee electricity committee intimating that they contemplated introducing motors to drive their larger machines, some of which require to run continuously throughout the night, and suggesting that the Corporation should allow them a throw-over switch, permitting of power being drawn from the public mains. This, required at odd times principally through the night, would be a considerable convenience, and would save the running of the main engine. The electricity committee, on the advice of the engineer, decided not to proceed in the matter.

CROYDON BOROUGH COUNCIL on Tuesday considered the offer by the British Electric Traction Company for the purchase of the tramways which belong to the Corporation and have been leased to the company. The Corporation having given notice to terminate the lease, the company submitted fresh offers, which were rejected, and they then offered to buy the whole undertaking and pay over one-half of the net profits, leaving to the town the right of repurchase in twenty-five years. The Council rejected the offer, as well as fresh proposals for re-leasing the system.

THE Manchester Association of Engineers held a meeting on Saturday, when Mr. G. F. Metzger read a paper on "Modern Electrical Developments." Mr. Metzger, in the course of his paper, dealt with the electric driving of cotton mills. Experiments had, he said, been carried out with great success, but the conservatism of millowners had still to be broken down. Electrical engineers only should be responsible for drawing up specifications and superintending the necessary work for the electric driving and lighting of mills, not only to minimise the risk of fire, but especially to obtain the plant suited to each particular case. Experience in other countries proved that electrical driving was more economical and realised larger outputs than mechanical driving. The steady running required for spinning and weaving, as well as the variable speeds necessary for bleaching, were met exactly by electricity. Constant speeds could be assured by installing alternating three-phase motors, whilst direct-current motors were capable of being driven at speeds of any variation. Moreover, electric driving in mills by its flexibility and simplicity guaranteed increased outputs, due to higher speed, and a considerable saving in the cost per pound of yarn turned out. By subdividing the main source of power into three units, one being spare, freedom from breakdown was assured, and at the same time portions of the mill could be run during overtime without spoiling the head-factor of the plant. "It is only," Mr. Metzger continued, "during the last twelve months that millowners have realised the practicability of this application of electricity, and mills are now building

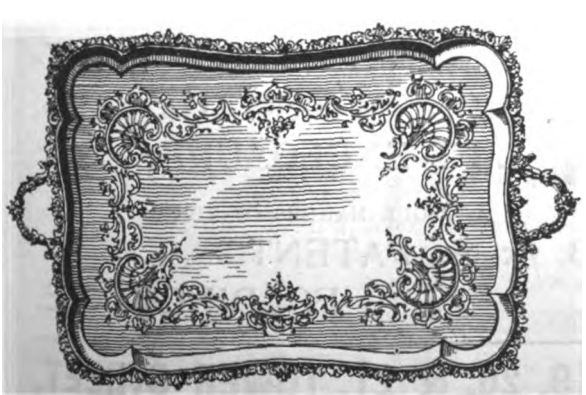
electrically equipped throughout. When the working results are published they cannot fail to impress the textile world, and further developments on a large scale may undoubtedly be expected in the industry."

NEW CATALOGUE.

THE T.T.E. high-speed lathes are those manufactured by the well-known Tangye Tool and Electric Company, Ltd., of Birmingham. The experience of the last four years has proved the fitness of the entirely new designs and patterns which were selected after an exhaustive series of experiments in "high speed" steel tools. Their chief improvement was a special arrangement of "single pulley" headstock. This has no cone pulley, but instead it has a single pulley carried on a side shaft which can be made any required diameter and width. This method is found to secure ample belt power with a moderate speed of driving pulley; it also removes the pull of the driving belt from the spindle to a separate shaft running in long gun-metal bearings with oil-ring lubricators which will work for long periods without attention. The gearing, which is totally enclosed, is all machine-cut from the solid, all the pinions and most of the wheels being of steel to secure ample strength. Messrs. Tangye, besides manufacturing the standard high-speed lathes, also turn out a number of special electrically driven machine tools. The catalogue includes, in addition to numerous lathes, illustrations of their machines for drilling, radial drilling, face milling, vertical drilling, milling, and screw cutting, and, lastly, a steam-driven motor.

THE GARDEN CITY.



IN their report for the year ended September 30 the directors of the First Garden City state that the accounts do not convey an adequate impression of the rapid and substantial progress which the company has made during its two years' operations. The total value of shares now allotted (including those allotted to the Pioneer Company) was 129,915*l.* in 5*l.* shares and 1,412*l.* in 1*l.* shares. The directors had also made a private issue of debentures, which, for the present, was restricted to 20,000*l.* Of this sum over 10,000*l.* had already been subscribed or promised by the directors and their friends. The total outlay upon the estate was about 41,000*l.*, including management expenses. The number of houses, &c., erected or in course of erection on February 1, 1905, was thirty-six; but on September 30 it was 280, representing a capital value of about 90,000*l.*, and leases had been granted, or arranged for, containing definite covenants to erect an additional 150 houses, shops, &c., of a value of about 45,000*l.* The total resident population is now over 1,500, including the original population of 400, and houses are at once required for an additional hundred families. It is anticipated that by the end of next month there will be 200 houses using gas from the works of the company opened in October last. Twelve miles of water mains have been laid, and 276 houses connected with them. A large number of workmen's cottages will be erected within the next few months, the workmen employed on the estate in factories, workshops, and building operations numbering about 500. Arrangements are being made to give work to a number of unemployed workmen from London on terms beneficial to the company and at the same time useful to the central unemployed committee. A public elementary school has been opened on the estate for the benefit of the children of the new residents. An endeavour is being made by a local body called the Garden City Educational Council, with the assistance of the Hertfordshire County Council, to run the school on improved lines. The aim is to provide an education equal to that of the average secondary school. Further capital is required for the prosecution of the enterprise.

THE general purposes committee of the Birmingham City Council have decided to recommend the Council to acquire 94 acres of land for use as a public park. The Lightwoods Extension and Wardley Woods committee, which have already purchased 26 acres of land, have the option of acquiring 94 additional acres, and towards the cost have raised nearly 15,000*l.* in subscriptions. This sum the committee will hand over if the Council agree to purchase the additional land, which will require the outlay of a further 25,000*l.* or 30,000*l.*

WORK IN EGYPT.

At the opening of a railway between Port Sudan and Berber Lord Cromer referred to forthcoming works. His Lordship said that since the appearance of Sir William Garstin's epoch-making report it had been demonstrated that the material guarantee of Egypt is intimately bound up with that of the Sudan. It is the river Nile which connects them, and it is certain that any large works undertaken in the future to benefit Egypt must be constructed not in Egypt proper, but in the upper regions of the Nile Valley. This railway was, therefore, the first and preliminary step in the gradual execution of a large scheme for the construction of works of public utility. But before the country can gain the full advantages to be derived from the undertaking further works must be constructed. Some, indeed, have already commenced. The port is springing into existence. Before many months have elapsed he hoped that the railway from Kareima to Abu Hamed will be opened, and will thus put the wealthy province of Dongola in direct communication with the sea. Irrigation works are about to be undertaken to utilise the waters of the Gash, and thus fertilise the plains in the neighbourhood of Kassala. Borings are about to be made with a view to the construction of a bridge over both the Blue and White Niles at Khartoum. Railway surveys are being undertaken with the ultimate object of bringing Kassala into communication with the main line, of extending the railway up the left bank of the Blue Nile, and of enabling the gum of Kordofan to find a ready market by bringing El Obeid into direct communication with Omdurman. It is not to be supposed that all these works will be at once remunerative. Undertakings of this sort cannot possibly pay in the first few years of their existence, but will ultimately prove remunerative.

A SOUTH SHIELDS SCHOOL.

A new school is about to be opened in Gilbert Street, South Shields. It consists of a central hall, with seven classrooms arranged round three sides of the hall, and separated therefrom by glazed partitions. The hall is 71 feet long, 26 feet wide, and 19 feet high. It is lighted by large mullion windows along one side. There are four classrooms, each 23 feet 6 inches square, and each allowing for sixty scholars and a superficial floor area of 9 feet per child. There are two other classrooms, each 27 feet 10 inches by 19 feet 6 inches, and another 21 feet by 23 feet. Cloak-rooms are provided in close proximity to the entrances, and included also is a teachers' room, 15 feet by 11 feet 6 inches, and all requisite facilities. The floors of the central hall and classrooms have been laid with pitch pine wood blocks. Internally, the walls have a cream-coloured glazed tile dado, with chocolate-coloured capping and skirting, which gives the school a light and clean appearance. The walls above the dado are distempered. The playground is finished with tar paving, and there is a covered play-shed with seat and drinking fountain. Special attention has been paid to the sanitary arrangements. The buildings are heated and ventilated throughout on the Plenum system. The building is of brick, with red-brick facings and stone dressings, and finely designed and proportioned, with due regard to economy. The cost, however, has been larger than would have otherwise been the case owing to the necessity, through the site being "made" land, for taking the walls down a considerable depth to a solid foundation. The contract price of the building is 5,516*l.* 4*s.* 6*d.* The school has been erected from the designs and under the superintendence of Mr. J. Walter Hanson, architect, South Shields, by the contractors, Messrs. Glen & Moffett, of Jarrow.

At the Surveyors' Institution, Westminster, Sir E. Boyle, K.C., M.P., sat on the 29th ult. as arbitrator in a case between the London County Council and the Westminster Electric Supply Corporation, arising out of the London County Council Improvements Act, 1900. It was explained that in order to make way for the Westminster improvement it was necessary to remove a generating station belonging to the company in Millbank Street with a river frontage. A new site had been offered by the London County Council in Horseferry Road, and the question which the arbitrator was asked to determine was whether that site was equivalent to the one of which the company was being dispossessed. It was larger by 694 square feet than the old one.

ARCHITECTS AND BUILDERS PLEASE NOTE.

CALL AND SEE THE PATENT "GASCOL" STOVE.

The special attention of all Architects and Builders is called to the "GASCOL" patent stove, which is a self-setting stove, which can be heated by either gas or coal, or both at once, effecting a great saving when a small fire is required for warming purposes.

Some Striking Advantages of the "GASCOL"

The "GASCOL" patent stove is constructed on scientific principles, and is exceedingly economical in use, the Oven, with tap full on, consuming but 10 feet of gas per hour. It is strongly built and the fittings are of the best quality. The change can be made in a moment from coal to gas, or *vice versa*. The Gas Hot Plate is fitted with one Boiling Burner, one Simmering Burner, and one Combination Griller and Boiling Burner, with Rise and Fall Double Deflectors, along with a strong tinned Grill Pan and Grid. The Oven is fitted with two Burners, two Runners, one Grid Shelf, and one Browning Sheet, all of which are detachable, and can be easily removed for cleaning. The Gas Connection can be made either at back or front of the Range. The "GASCOL" is simple in action, automatic in working, and is the ideal cooking stove for villas, flats, &c. It is, moreover, exceedingly moderate in price. All Architects and Builders are requested to call and see the "GASCOL" at any of the leading Wholesale Ironmongers, or it may be seen in operation at the showrooms of

Architects' Benevolent Society.

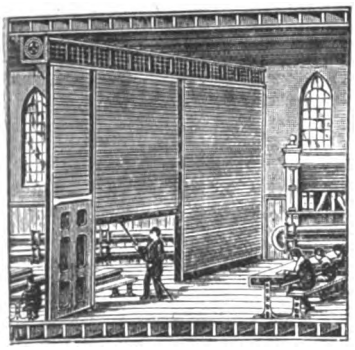
This Society, founded in 1850, is the only Institution in the United Kingdom specially organised to assist Architects, Architects' Assistants, or their widows and orphans. During its existence the Society has been instrumental in alleviating the distress of many hundreds of cases. Yet not more than one per cent. of architects in active practice contribute to its support. To meet the demands of deserving applicants fresh annual subscriptions are urgently needed.

In response to the President's recent appeal on behalf of the Society, Mr. Walter Emden has offered to contribute £50, if nine other gentlemen will contribute a similar sum.

In addition to forming one of the nine contributors, Mr. William Glover has promised a second donation of £50, if a further £450 is contributed before Christmas.

Contributions will be gratefully received by the undersigned,

W. HILTON NASH, Hon. Treasurer,
PERCIVALL CURREY, Hon. Secretary.



9 Conduit Street, Hanover Square,
London, W.:
November 1905.

"THE BANQUET."

REVOLVING SHUTTER PARTITIONS

FOR THE DIVISION OF SCHOOLS, COLLEGES, &c.

AS FITTED BY US TO THE BIRMINGHAM, LIVERPOOL, BRIGHTON & OTHER BOARD SCHOOLS.

Adapted to existing Schools, as also those in course of erection. Saves the Strain on Teachers, and enables them to obtain better results by Isolating Classes. Retains all the Advantages of the Large Room for Meetings, Examinations, &c. Can be Cleared Away in Three Minutes, and leaves Unobstructed Space. Do not take up extra gangway space. Can be used in Rooms having Galleries and Hot Water Pipes at the sides.

Also Manufacturers of FOLDING & SLIDING PARTITIONS.

REFERENCES TO SCHOOLS THROUGHOUT THE COUNTRY. ESTIMATES FREE.

EXPERIENCED WORKMEN SENT TO ANY PART OF THE KINGDOM.

HODKINSON & CO., LTD. Canada Works, Hawkes Street, **SMALL HEATH, BIRMINGHAM.**

GOOD ADVICE.

Architects, Contractors, and others are recommended to journey by the

GREAT CENTRAL RAILWAY.

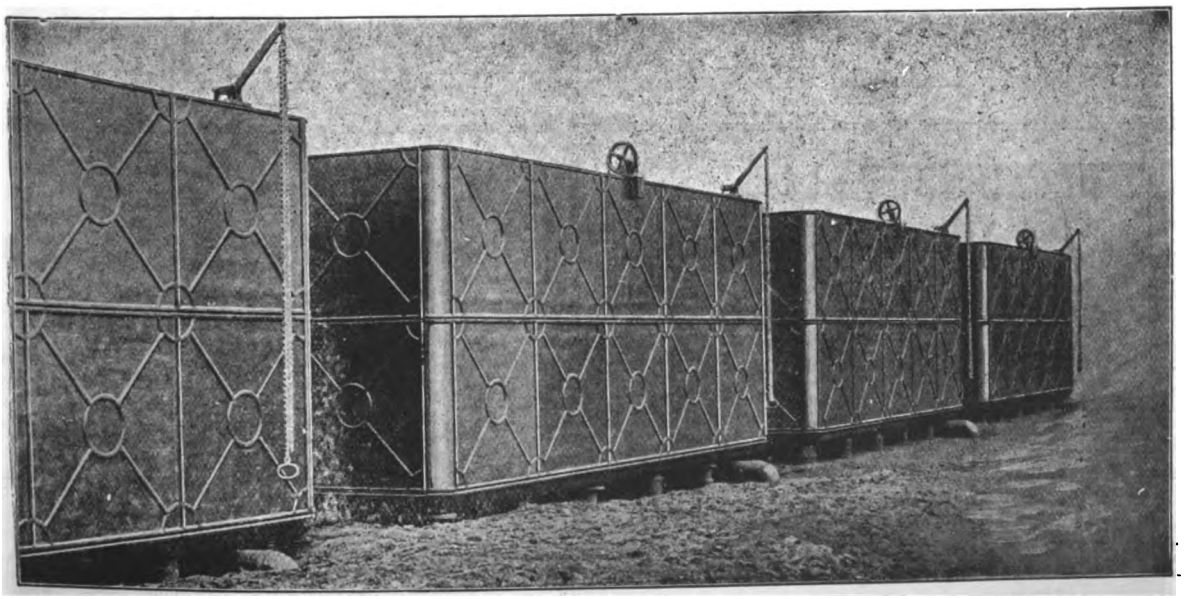
They will find it

RAPID TRAVEL IN LUXURY.

Each Express is VESTIBULED and has a BUFFET CAR attached available for FIRST and THIRD-CLASS PASSENGERS.

The London Express Trains centre on Sheffield, branching therefrom westward to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool; northward to Huddersfield, Halifax, Bradford, Leeds and York; eastward to Doncaster, Grimsby, Hull and North Lincolnshire.

Cross Country Expresses and Through Arrangements with other Companies are a distinct feature of the Great Central services. Liverpool, Manchester, and Sheffield are linked up by corridor trains with Lincoln, Harwich, Lowestoft, Norwich, and the Great Eastern system.



Newcastle, Sunderland, Durham, York, Bradford, Huddersfield, Rotherham and Sheffield are provided with through trains *via* Nottingham, Leicester, Banbury and Oxford, to and from Southampton, Bournemouth and the South-Western Line.

Bath, Bristol, Exeter, Torquay, Kingswear, Plymouth, and the Cornish Riviera are reached by Express Trains from Leeds, Wakefield, Halifax, Huddersfield, Sheffield, Nottingham, and Leicester.

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. off ordinary fares.

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM. By HENRY BEYAART, Architect. This work contains the most interesting productions of Henry Beyaert, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work consists of 240 folio plates, in two portfolios. Price complete, £14 8s.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

ANSWER TO CORRESPONDENTS.

A has a zinc gutter on top of shop window which has perished. The water has percolated into his shop for some considerable time, of which fact he is fully aware. He had it repaired by tar and sand without effect. The plaster fascia was broken away, which was noticed by the Borough Council inspector, who condemned it. A was then obliged to shore up the building and put an iron bessemer in place of the wooden one. The rainwater has come through the adjoining party wall and rotted the next property bessemer 4 feet (the remainder is sound—about 9 feet). The party wall is found, when taking up floor to examine bessemer, to be corroded by fungus between the party wall and the joist. Who is liable, the leaseholder of damaged property (A), or the leaseholder whose property is damaged (B)? It is not dry-rot, but wet-rot, entirely caused by leakage. A holds his property under a repairing lease.

LEAKAGE (G. W. and C.)—We are of opinion that A is liable to repair the damage done to the property of which he is tenant, seeing that he holds it under a repairing lease. The lessor will probably compel the performance of his covenant. A is also liable in damages to B for the injury caused to his tenement.

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

SCOTLAND.—March 12.—For a school at Cartsburn, for the Greenock (Burgh) School Board. Conditions, &c., from Mr. A. F. Niven, clerk, Burgh School Board Offices, Municipal Buildings, Greenock.

WALES.—March 20.—For a free library to be erected in Bangor at a cost not exceeding 3,000*l.*, inclusive of architect's charges. Premiums of 25*l.* and 15*l.* respectively will be paid to the authors of the two approved designs. Premium for successful design to merge into the architect's commission. Deposit 1*l.* 1*s.* Application to Mr. Wm. H. Worrall, clerk to the general purposes committee, Municipal Offices, Bangor, North Wales.

CONTRACTS OPEN.

ACCRINGTON.—March 1.—For the erection and completion of a public library in St. James Street. Deposit 5*l.* Mr. William J. Newton, architect, Town Hall.

WENHASTON.—March 9.—For the enlargement of Wenhaston Council school, East Suffolk. Mr. Wallace Ellis, the corresponding manager, Wenhaston..

WHITWORTH.—Feb. 27.—For erection of bakery. Deposit 5*s.* Mr. T. F. Wood, secretary, Whitworth Friendly and Industrial Co-operative Society.

WORCESTER.—Feb. 20.—For the enlargement of Worcester head post office. Deposit 1*l.* 1*s.* H.M. Office of Works, &c., Storey's Gate, S.W.

WORSBROUGH.—Feb. 14.—For the whole or any portion of the works required in the erection of two houses, Mount Vernon Road. Mr. Arthur Whitaker, architect, Worsbrough Bridge, Barnsley.

PREPARATORY work has been commenced on the project for harnessing the Susquehanna Falls and River for an electric-generating plant to supply power to various towns and cities around Baltimore. A dam is to be constructed across the river at McCall's Ferry. It is stated that the cost of the work will be about 8,000,000 dols.

THE electric supply committee of the Birmingham Corporation have for some time past had under consideration the adoption of a motor-hiring scheme, the object being to benefit small manufacturers and at the same time to build up a profitable day load power output. They now recommend that they be authorised to supply motors and starting switches on the hire system, on terms of rental proportionate to the horse-power of the motor. The committee do not propose that any wiring work shall be carried out by the department. In case a consumer desires to purchase a motor that has been hired to him the committee propose to give facilities. It is estimated that a sum of 8,000*l.* to 10,000*l.* will be required for the working of the scheme for about the first two years. It is proposed to provide the necessary capital in the first instance from the revenue of the department, and to apply for a loan only after some experience has been obtained as to the extent to which manufacturers avail themselves of the scheme. A separate account will be kept and a balance-sheet will be presented to the Council in the annual accounts.

TRADE NOTES.

The work in mosaic at the Caerleon asylum, Newport, was laid by Diespeker, Ltd., of London, Liverpool, Glasgow and Belfast.

The fireproof partitions which are several thousand yards in area at the Newport borough asylum, which was recently opened, have been erected on the "Dovetail Corrugated System" by the Fireproof Company, Ltd., York Buildings, Adelphi.

A large new clock has been erected on the tower of St. Peter's Church, Hereford, and was formally started by the deputy-mayor on the 1st inst. The clock was made by Messrs. John Smith & Sons, Derby, who made the Hereford market clock a few years ago.

Messrs. Helliwell & Co., Ltd., of Brighouse, Yorkshire, and 11 Victoria Street, Westminster, London, having completed the glazing with their patent "Perfection" system without putty on the New Cross and Camberwell car sheds (131,000 super. feet) for the London County Council, have now received the contract for the glazing to the new car sheds in Jews Row, Wandsworth, and the sub-stations at Streatham, Battersea and Wandsworth.

A fire broke out on the 25th ult. at the Rochdale Cotton Spinning Company's mill, Rochdale, in one of the mules in the top spinning-room, which but for the prompt action of three of Mills's modified "Titan" automatic sprinklers, 1903 patent, would have assumed very serious dimensions. As it was, little damage was done, and the firm have written to Messrs. Mills complimenting them on the highly satisfactory way in which the sprinklers operated and the quickness of the alarm given.

Revolving sewage sprinklers form an important specialty of Messrs. George Jennings, Ltd., Lambeth, London, who have supplied them to many local authorities at home and abroad. This firm has made great progress in this branch of sanitation. We understand some of their machines are in operation at the Yardley Rural District Council's sewage works near Birmingham. They were adopted after the committee had visited some of the most important sewage works in this country. Mr. Arthur W. Smith, engineer and surveyor to the Council, designed the works, and, after thoroughly testing the apparatus, writes as follows:—"I have pleasure in informing you that the four 80 feet sprinklers and the automatic syphonic feed apparatus fixed in September last at the Cole Hall sewage disposal works have worked without a hitch, and have given entire satisfaction."

Messrs. W. & T. Avery, Ltd., of the Soho Foundry, Birmingham, have now under construction for the engineering section of the Birmingham University a huge machine for testing whole members of constructional work, such as complete girders, columns, roof principals, and every part in the construction of bridges, roofs, and machinery; in fact, the machine will test any and every part that can possibly be used in engineering work. The machine is designed to test specimens for tension, compression, and transversely. The maximum capacity is 300 tons, the total length 70 feet, and the weight of the metal in the machine is about 85 tons. The strain is applied by an hydraulic cylinder and ram, and is arranged to test specimens in tension up to 25 feet, in compression up to 30 feet, and transversely up to 20 feet long. The machine is one of the largest testing machines that have ever been made, and is specially comprehensive in order to give a wide range of tests, and is so arranged that an official can govern from one position the hydraulic power applying the strain and the recording steelyard. The machine will be a great acquisition to the university.

The result of a poll of the ratepayers of Hull declared on Saturday has decided that a Corporation Bill should be proceeded with. The principal item is a proposal to provide a landing-stage for fruit and other traffic at a site known as the Western Reservation, adjoining the Alexandra Dock, at a cost of over 200,000*l*.

CATHEDRAL SERIES.—TRURO: VIEW FROM NORTH-WEST.

BUILDING AND BUILDERS.

THE Dundee School Board have approved of a scheme to erect a supplementary course school at the East End, to accommodate 1,070 pupils, at an estimated cost of 15,000*l.*

THE Medway Guardians have adopted the report of the laundry committee recommending the Guardians to construct a new laundry at an estimated cost of 6,000*l.*

ALDERMAN ODDIE stated at Blackburn Town Council, says the *Daily Telegraph*, that the irregular-shaped, useless bits of land which were often left when building schemes were completed were known in the trade as "builder's baby." One such piece had been offered to the Corporation for a recreation ground at twice the price asked for building purposes, but the Council decided to await an amended offer.

THE Glasgow Master Masons' Association state in their annual report that, as regards the Glasgow Royal Infirmary reconstruction, after receiving representations from the Association and the Operative Masons' Association the managers of the infirmary have resolved to use white freestone as may be obtained from the neighbourhood and elsewhere in place of terra-cotta blocks, as was at first proposed.

MR. F. J. WILLIS, inspector of the Local Government Board, held an inquiry at Rochdale into an application of the Town Council for a provisional order giving them amended powers in respect to their building by-laws. The present regulations were described by the town clerk as being too restricted. The by-laws deal with the height of rooms and the thicknesses of walls in new buildings. There was no opposition.

A SPECIAL committee of the Leeds Corporation appointed to consider a proposal for a municipal works department on the 6th inst. drafted four questions, which are to be submitted to the Corporations of London, Glasgow, Liverpool, Manchester, Sheffield, Birmingham and Cardiff. The questions are as follows:—Does your municipality do its own sewering? Does it pave all its new streets? Does it build all its own buildings? Has it a permanent staff for keeping its buildings in repair? The committee propose to visit the municipalities where such works are carried out.

THE town clerk of Liverpool has issued a report as to the number of men employed by the various committees at a less wage than 4*s.* per day. In the surveyor's, veterinary, library, baths, and city lighting engineer's departments there are no men employed at less than the wage stated. In connection with the tramways there are forty-nine. In many cases these men are of long service, and their present positions have been held open for them due to that long service, and in some few cases the men are younger, but they are not able-bodied or capable of ordinary labouring work. In the markets there are three men so employed, none able-bodied; and in the water engineer's department there are three watchmen and two labourers who receive a wage of 3*s.* 8*d.* per day each. In the city engineer's department there are 546 men employed at less than 4*s.* per day, and there are twelve men whose hours of labour have been increased since the resolution was passed giving a minimum wage of 4*s.* to all able-bodied men. In the electric lighting department there are four men (including watchmen and cleaners), and under the parks committee eleven men receiving less per day than 4*s.*

THE borough accountant of Camberwell has prepared a report as to empty properties and the loss of rates thereon, showing that there has been an increase in the percentage from 2.50 in April 1902, to 3.89 in April 1905. In the districts of Nunhead and Herne Hill the increase has been practically 100 per cent. During the same period the loss of rates on houses returned as "empty" has risen from 4.86 to 7.01 in Lewisham; from 2.89 to 4.15 in Finsbury; from 1.95 to 3.10 in Islington; and from 1·89 to 3.05 in Stepney.

ELECTRIC NOTES.

A poll of the ratepayers of Oxford has overwhelmingly disapproved of a proposal of the City Council to apply for a Bill authorising the application of electricity to the present tramway system.

The Lincoln City Council are to apply to the Local Government Board for sanction to the borrowing of 13,000*l.* for additions and extensions at the electricity works, and for cables, &c.

The Pennsylvania Railroad Co. has announced that the company has decided to construct and operate a high-speed electric railway connecting Newark with New York City, reaching the terminal of the latter city by means of the McAdoo tunnel under the Hudson River.

Owing to the recent fusion at the corner of Cross Street and Market Street, Manchester, the gas committee has asked the electricity committee to give instructions for extra precautions to be taken with regard to insulation where electric cables have to be laid in close proximity to gas mains.

A concession has been granted to a syndicate headed by M. Dunand, of Geneva, for the construction of an electric tramway between Versoix and Divonne-les-Bains, viâ Nyon, Prangins and Coppet. The cost of the enterprise is estimated at about 38,000*l.*, of which about 7,972*l.* is to be expended on rolling-stock.

The committee of the Athenæum Club have elected Professor Sir A. B. W. Kennedy, F.R.S., under the provisions of Rule II. of the club, which empowers the annual election by the committee of three persons "of distinguished eminence in science, literature, the arts, or for public services."

The change in the Worcester tramway system from horse traction to electricity has been attended by a great increase of revenue. The receipts for the year amounted to 15,000*l.*, compared with an average of 5,000*l.* under the old system. Although the population is under 50,000, there were nearly six and a half million passengers carried, while the mileage was over 823,000. Further extensions of the system are promised.

The Lancaster Town Council at their last meeting held a long discussion on the proposal to supply the London and North-Western Railway Company with electric current for motive power at 1½*d.* per unit. It was argued that the cost of production was greater than the price quoted, but the committee said that it would be a day load, and the fixed charges would be the same whether the new customer was taken on or not. Eventually, by twelve votes to ten, the recommendation was agreed to.

The Grand Trunk Railway Company have decided to use electricity as a motive power for their trains running through the new tunnel from Sarnia, Ontario, to Port Huron, in the State of Michigan, under the St. Clair river. The tunnel, which with its approaches is over two miles long, affords the most direct route to the West, and has been constructed in preference to erecting a high bridge at this point. The electrification of the tunnel has already begun.

The Great North of Scotland Railway Company have entered into an agreement with the Aberdeen Town Council by which they will obtain from the Council a supply of electricity for use either in their stations, offices, workshops or hotel, for four years, at a flat rate all over, for lighting and power, of 2¼*d.* per unit, on the company undertaking to consume or pay for 110,000 units per annum for the first two years, and the same price per unit for a guaranteed consumption of 120,000 units for the second two years.

The Nottingham County Council are opposed to the present conditions under which tramways are laid on the county main roads, which are in many cases of an inadequate width for the purpose. The report of the county surveyor, which is to be forwarded to the County Councils Association, states that the tramways were an undesirable addition to the traffic of the highways, and that where they were allowed, a minimum width of 33 feet of metal road should be insisted upon for other traffic in the case of a double line of rails, and 27 feet in the case of a single rail.

At the half-yearly meeting of the London, Brighton and South Coast Railway it was stated, in connection with the electrification of the London Bridge to Victoria line on the single-phase alternating current system, that the railway company were now in active negotiation for a contract with the General Electric Company of Berlin, and in the arrangements with that company it was proposed to require that, with the single exception of the motors for the first set of

Digitized by Google

eight trains, the whole of the plant should be of British manufacture.

Two unusually high electric derricks have been installed in Messrs. John Brown & Co.'s yard at Clydebank for use in the building of their express Cunarder, which will be of great height. They are designed to raise a load of 5 tons to a height of 120 feet from the ground level, with a working radius of 35 feet from the centre of the mast, and with a jib slewing through 180 degrees. The mast is in each case an open latticework column of square sections, 6 feet square at the centre and tapering to 18 inches at the ends. The platform for the electrical gear is at a height of 95 feet from the ground level.

THE Rosario Muncipality is now inviting tenders for the public lighting of that city. Tenders will be received up to April 16. The Bahia Blanca Municipality, in view of the numerous fatal accidents that have been taking place from the defective electric-light installations, have resolved that the public and private service be immediately suspended and not renewed until the installations have been changed and the voltage altered. In the meantime the public lighting will be carried out by means of kerosene lamps. It is understood that the whole of the system of mains and installations, power-house, &c., is in a most deplorable condition.

THE Munich Post Office have used the municipal electric tramways for the transport of letters and parcels between the central and branch offices since July 1905. The tramway company furnished two cars at a cost of 600*l.* each, the driver and conductor of each of these cars being officials of the postal authorities. The platforms of the cars are closed, the interior, lighted electrically, being divided into two compartments, the larger one for ordinary and the smaller one for registered postal matter. The windows are protected by strong iron gratings, the doors being also of iron. The postal authorities pay an average of 2½*d.* per kilom., a quota of 4 per cent. for expenses incurred and 6 per cent. amortisation.

THE electric supply committee of the St. Marylebone Borough Council has presented revised estimates of the capital expenditure required to complete the electric-lighting scheme. The estimates under both the main heads have been exceeded by a total sum of 84,246*l.*, and, adding 38,500*l.* for the site, the amount is 122,746*l.* On the other hand, it is estimated that at least ½*d.* per unit in the cost of generation will be saved, making 15,200*l.* a year to the good. In addition, the large estimated loss in 1905 has been avoided. The borough will require sanction from the County Council for a loan of 151,162*l.* to complete the scheme. Of this 15,000*l.* has already been applied for. The expenditure will be distributed over the next two and a half years, and the amount required in cash will be diminished by the amount realised by the sale of old plant and surplus properties.

ALL the leading electrical firms in Germany have done a much more profitable business in 1905 than in the preceding year. According to the *Manchester Guardian*, in some cases the higher percentage of profit has been very considerable, and all branches of the industry have profited. In consequence of the increased demand prices have risen, and although a larger number of hands was employed, most firms have had to work overtime throughout the year. The manufacture of dynamos, electro-motors, transformers and accumulators was continually hampered by the lack of skilled labour. The manufacture of cables (especially lead cables) was brisk, and a good trade was done with foreign countries. Lighting accessories and carbons were in brisk demand. The exports of electrical plant were as follows, in tons (1904 figures in parentheses):—Cables, 28,773 (19,028); accumulators, 2,841 (2,576); electric machines, 12,786 (12,164); telegraphic apparatus, telephones and microphones, 604 (574). After Russia and Central and South America, the principal increase in exports has been to Holland and Belgium.

THE following is the settlement arrived at in an action brought by Mr. J. Emmott Barlow, M.P., against the Manchester Corporation on account of injury and inconvenience arising from vibration set up in the adjoining electricity works:—Mr. Barlow to be recouped all expenditure to which he has been or may be put by reason of the vibration occasioned to his warehouse either before or during the course of the action, together with interest at the rate of 5 per cent. from the respective times of payment by him. Until the purchase money for the property is actually received by Mr. Barlow the existing payment of 1,000*l.* a

year to continue to be paid by the Corporation. The value of the warehouse and the injury sustained in respect of Mr. Barlow's adjoining property are for the purposes of the arbitration to be taken to be its value at March 1899, a date anterior to the first complaint of vibration. The purchase money and compensation to be assessed on the basis of a compulsory sale by Mr. Barlow to the Corporation, the effect of which would be to entitle him to an addition of 10 per cent. upon the purchase money. Mr. Barlow to receive the sum of 1,000*l.* as damages on the action being terminated. His costs as between solicitor and client of and incident to the agreement for reference, the arbitration, and the vesting of the property in the Corporation, and also all disbursements made by him for that purpose, to be paid by the Corporation.

VARIETIES.

The new sewage scheme to be carried out at Cheltenham will cost about 50,000*l.*

Mr. Sydney H. Morgan has been unanimously appointed surveyor to the Prestwich Council. There were about 300 applicants.

According to an official report presented on the 6th inst. to the Warrington Town Council, there are over 17 miles of unpaved streets and passages in the borough.

The Metropolitan Asylums Board have agreed to the recommendations of the asylums committee concerning the provision of better means of escape from Leavesden asylum in case of fire. Bridges are to be provided.

On Tuesday the directors of the Clarence Pier, Southsea, decided to expend from 10,000*l.* to 15,000*l.* on the extension of the pier for the purpose of providing further accommodation for the steamboat service.

Sir Henry Campbell-Bannerman has stated that "a Royal Commission is shortly to be appointed to consider and report upon the whole position of internal water transit."

The Bournemouth ratepayers on Saturday, on a poll taken by the Corporation, decided against the proposal to obtain parliamentary powers to erect a pavilion or kursaal at a cost not exceeding 60,000*l.* at the shore end of the present pier. Only a third of the electorate voted.

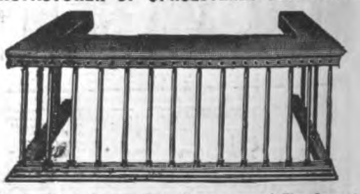
The Gourock Town Council have appointed a committee to consider the question of a site for the erection of a town hall and corporation chambers. It is stated that negotiations are being entered into for the purchase of a block in the centre of the town, the price of which is put at 6,000*l.* to 7,000*l.*

The Corporation of Margate are considering the proposals to construct a sea-wall and promenade between Fort Point and Clifton Baths, or between the Baths and Newgate Gapway. The making of 2,000 concrete blocks, which can be used for either undertaking, has been decided upon.

The Gas Light and Coal Company were informed at their annual meeting with reference to the subject of heavy motor traffic and the damage done to the gas mains in the streets, that in 1899 they had eighty-seven cases of broken mains and drawn joints, while last year in the same thoroughfares they had 687.

Mr. Pilditch, who contested the Western, or St. Ives, division of Cornwall at the General Election in the Unionist interest, though unsuccessful in winning the seat for his party after all the other seats in the county had been lost, polled more votes, with one exception, than any other Unionist candidate in the county.

A conference has been held by representatives of the principal firms of brassworkers in Birmingham and district, at which it was decided to take steps preliminary to the provision of a school for brassworkers on the lines of that already established for the jewellers' trade. There are, it is believed, 60,000 brassworkers in the city. The effort is the result of a report by three members on their recent visit to Germany.



A Model Lodging-house on the lines of the Rowton houses was opened on Monday at Newcastle-on-Tyne. The

contract was let to Mr. S. F. Davidson, of Newcastle. The building has a frontage of 162 feet on the Dog Bank. The mean height is 74 feet, and the house is so situated that the sun may shine into each of its windows at some part of the day, winter and summer. There is accommodation for 240 persons. Mr. J. C. Maxwell designed the building.

THE Tottenham District Council some years ago acquired several acres of land for the erection of workmen's dwellings, and a scheme to cost 100,000*l.* was prepared. The Council have now resolved by a large majority to dispose of the land (which was said to have doubled in value), subject to the consent of the Local Government Board. It was stated that Tottenham would be able to take advantage of the London County Council's housing estate at White Hart Lane.

THE Hull City Council have made a grant of 1,000*l.* to the voluntary contributions fund of the Hull distress committee, out of the profits of the municipal undertakings. The town clerk asserted that the proposed expenditure would be illegal, and the resolution if carried could not be acted upon. Several members intimated their willingness to sign a cheque for the amount asked for, only one member voting against the resolution.

THE Matlock and Matlock Bath Urban District Councils are both, under orders of the Court, at the instance of the Derbyshire County Council, to carry out sewerage schemes within a limited period. Last night members of both Councils met at the Matlock Bath Council offices in conference on the question of a joint scheme. The two Councils have had engineers at work for months past, viz., Mr. Diggle, of London, for Matlock, and Messrs. Winstanley & Co., of Manchester, for Matlock Bath.

A SEQUEL to the prosperity of the steel trade for the past few months was a conference at Swansea on January 30 between representatives of the Steel Smelters' Union and South Wales steel manufacturers for the purpose of considering a demand by the men for a general advance of 10 per cent. in wages. The masters intimated that the correspondingly high price of raw materials left little margin for profit, but consented to consider the application, and the conference adjourned for a week. About 4,000 men are affected.

A LOCAL Government Board inquiry was held at Redditch on the 30th ult. into an application made by the Redditch District Council for permission to borrow 3,750*l.* for works of sewerage, including the execution of works in North Redditch. It was proposed to construct a sewer to take the sewage from Headless Cross. This at present is dealt with on a farm, but this has to be abandoned in June, on the expiration of the lease. This sewer would connect with another new sewer to serve the Hewell Road district, where the Enfield Cycle Company are about to erect a large factory to accommodate about 1,000 employées.

THE contract for No. 1 section of the Enfield and Stevenage line has been awarded by the directors of the Great Northern Railway Company to Mr. H. M. Nowell, of Newcastle-on-Tyne. The length of line is about five miles, and the work will take at least two years to complete, passenger stations being established at Enfield, Lavender Hill, Cattlegate and Cuffley. Included in the work will be the erection of twelve bridges and two viaducts, the last-named having a length of 900 feet and a height of 74 feet. There will be over 1,000,000 yards of earthwork, about 50,000 yards of brickwork and concrete, and 350 tons of steelwork required in the contract.

THE Metropolitan Water Board in August resolved to put in hand, at an estimated cost of 160,000*l.*, the completion of a covered reservoir at Honor Oak. The construction of the reservoir was begun by the Southwark and Vauxhall Company under an Act which, it has now been discovered, stipulated that the work must be completed within seven years from the date of its being passed—August 1901. The Local Government Board, applied to by the Water Board for a loan, has expressed the opinion that, under the circumstances, the Water Board has no power to undertake the work. The board's engineers, however, report that the need for completing the reservoir is pressing, and it was accordingly decided to put the work in hand and petition Parliament for the necessary powers.

AT a meeting of the Wolstanton Urban District Council at Chesterton, the sanitary inspector reported that he disinfected a house, and that the premises took fire, considerable damage being done. The fire had evidently been

caused by a defective sulphur candle, which appeared to contain some foreign substance. The medical officer and surveyor, who had inspected the premises, agreed with the inspector as to the cause of the fire. The tenant of the house had made a claim against the Council amounting to 36*l.* The Chairman said that, while denying liability in the matter, the Council had done everything that was possible for the tenants. Bedding, &c., had to be provided, and the Council had spent 7*l.* or 8*l.* already. A resolution was adopted expressing regret at the accident and consequent loss and inconvenience to the tenants, but denying all liability for the damage done. The Council found that the inspector used every care in the matter and exonerated him from blame. It was also decided to obtain an analysis of the defective sulphur candle.

The opinion of the workmen in Portsmouth Dockyard as to which of the two schemes for a uniform working week of forty-eight hours they preferred has been taken. The heads of the various departments, through the foremen and recorders, called the men together during the week and ascertained very briefly their opinions on the two schemes, A or B. In both cases the hours were the same for the first four days of the week—seven to noon, then an hour and a half for dinner, and closing work at five. In "Scheme A" work would close at 5.30 on Friday and at noon on Saturday, but under "Scheme B" the men would only have three-quarters of an hour for dinner on Friday. They would, however, leave work at quarter to five and at noon on Saturday. Payment would be made at ceasing work on Friday afternoon. The results were reported to the Admiral-Superintendent. They showed that by an overwhelming majority the men favoured "Scheme B," and those will, no doubt, be the working hours after April 2.

Sir John Cheyne, K.C., the Commissioner appointed by the Local Government Board for Scotland, recently conducted an inquiry in Ladybank, N.B., in connection with an application by the Town Council for a provisional order for the construction of new sewerage, drainage and water-supply schemes for the burgh. Evidence in favour of the schemes was given by Mr. Henry Bruce, C.E., Cupar, and Mr. Proudfoot, C.E., Cupar. At the conclusion of the evidence Sir J. Cheyne stated that a complete case had been presented on behalf of the Corporation, and as he was satisfied that the schemes would be of great advantage to the burgh, he would report favourably to the Local Government Board.

NEW CATALOGUES.

Hatherley Works, Gloucester, might be recommended to any visitor to this country desirous of seeing a high-class factory for ladders, tables, seats, &c. The premises cover more than 2½ acres, and are imposing from mere size, and especially to a spectator looking at the water-tower and premises from inside the works. No less than 15,000 step-ladders are always in stock, and the drying-sheds are filled with timber valued at many thousands of pounds. A novelty is the inclined miniature tramway which conveys goods from the ground floor up to any desired storey. The buildings have lattice-wood roofs and girders; that of the shunting yard has a span of 50 feet in the clear. These splendid works are the property of Messrs. Allan Jones & Co., the patentees and manufacturers of the Hatherley Originalities. First and foremost are the Hatherley step-ladders, better known under the trade name of "Latti-steps." These steps stand upright in all positions, both closed and open, are without hinges or webbing, and, though light, are remarkable for strength and rigidity. They are made in thirteen different sizes in deal, birch, oak and teak, from two treads up to ten treads. Seven other sizes, from 10 feet 3 inches to 15 feet 9 inches for use in lofty rooms, halls, or for cleaning high shop-windows, are stocked in a heavier pattern in deal and birch. In addition to "Lattisteps" (trade-mark "Alhathlat"), Messrs. Allan Jones & Co. manufacture and stock seven sizes of a second quality step, having solid sides, and supplied under the trade-mark "Cajac," which are particularly recommended for use by the building trade. They obviate the risk of dangerous accidents to workmen. Lean-to ladders and double steps are also manufactured in both qualities. The "Hatherley" detachable bucket or tool tray fits securely over the top tread and overhangs at the back in a convenient position. Messrs. Allan Jones & Co. have, moreover, adapted their principles of construction to various kinds of tables, easels, step seats, forms, trestles, seats, underframes,

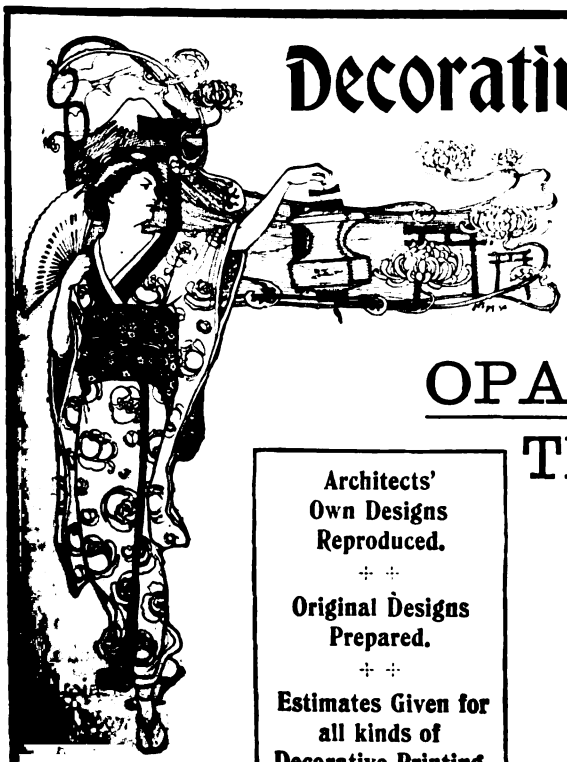
gates, fowl houses, &c., and claim to be able to execute the most complicated order on receipt. Customers in the colonies or abroad will find it to their advantage to read the export booklet, as it contains instructions which will enable the goods to be exported to them at a minimum of cost from Hatherley Works, Gloucester.



SCIENCE has discovered no more effectual way of dealing with rubbish than by consuming it. The Horsfall destructor therefore meets a need of modern life. If it had been in use at an early time the sanitation of cities and towns would have been improved. When we find that the destructor has been adopted by the city of Brussels, where it destroys from 180 to 200 tons in twenty-four hours, the power thus gained being used for electric lighting, electric cranes and other purposes, we may be assured that no more efficient plant can be devised among a people who are skilled in machinery. In Zurich also the Horsfall destructor has been at work since 1903. In Hamburg the plant has been in use for ten years. In England it is installed in Leeds, Bradford, Sheffield, Hull, Batley, Grimsby, Manchester, Accrington, Southport, Blackpool, West Hartlepool, Stourbridge, Leamington, Lowestoft, Ramsgate, Salisbury, Folkestone, Westminster, Fulham. The system has received the approval of scientific and sanitary authorities, and the company have been awarded the silver medal of the Sanitary Institute three times, the gold medal of the Brussels International Exhibition, and the destructor formed part of the plant which was granted a Grand Prix in the Paris International Exhibition of 1901. There are about 100 destructors at work or under construction. The company's catalogue contains photographs of those adopted by local authorities, as well as information concerning system of forced draught, boilers, dust-catcher, chimney, machinery, the refuse destroyed per twenty-four hours, and total horse-power available from combustion of refuse.

THE recent legislation concerning Metropolitan bakehouses can only be regarded as a preliminary effort to deal with a serious evil. It is no exaggeration to say that the majority of bakehouses, not only in London, but in the provinces, do not correspond with the ideas of sanitarians. If some of the bakehouses represented in the catalogue of Messrs. T. Melvin & Sons, of Glasgow, are taken as standards, we can see the shortcomings of those with which the public have to be satisfied because they are ignorant of their condition. Messrs. Melvin & Sons show various kinds of ovens on different scales, as well as fittings, and the machinery for kneading and other purposes by which a desirable cleanliness is insured for bread. They have also gas and oil engines, trucks, bread cases, hot-plates, water-heaters, and much else by which pure bread can be obtained. In that most desirable consummation architects can render aid by insisting on the use of such appliances whenever they have bakeries to erect for traders or in institutions. Machinery is never more usefully employed than in such buildings.

THE BUILDERS' EXCHANGE, BIRMINGHAM.

ON Thursday, the 1st inst., a large audience attended the first of the series of lectures at the Builders' Exchange, Birmingham. Mr. Wm. Sapcote, President of the Advisory Council, took the chair. He suggested that, in addition to the lecture, it would be of great interest if it could be arranged for a visit to the slate quarries described, and preparations are now being made to give effect to this suggestion.

The lecturer, Mr. H. Browning Button, took for his subject "The Underground Slate Quarries of North Wales." The lecture was illustrated by lantern slides, which showed the enormous difficulties to be surmounted in obtaining slates for building purposes. Among others were slides of the workings, milling operations, and means of transit, together with illustrations of the methods employed for examining the roofs of the huge chambers from which the slate has been extracted. It claimed for Welsh slates that their absolute superiority was based on geological grounds, the Welsh slate veins being in a strata of rock of considerably greater age than those of France and America. The slates from neighbouring quarries used in roofing houses in Blaneau Festiniog 80 to 100 years ago were as good as the day they were put on. The shipment of Welsh slates

from Portmadoc average 115,000 to 120,000 tons per annum. Statistics were quoted showing the development of imports in foreign slates. The lecturer stated these were unfit for use in districts where the atmosphere is charged with chemical fumes, and buildings on which they had been used had had to be re-roofed with Welsh slates.

BIRMINGHAM CORPORATION AND GASFITTINGS.

FOR some time past there has been discontent among gasfitters and others in Birmingham about the action of the Corporation in supplying, fixing and hiring gasfittings like a trading company. Recently a master gasfitters' association was formed, and one of the first acts was to send a deputation to the gas committee in the hope of obtaining an alteration in the manner of competing against the members. The secretary has received the following reply, which is not as satisfactory as is desirable :—

Dear Sir,—Referring to your letter of the 12th ultimo, addressed to Sir Hallewell Rogers, and in reply to your letter to this department dated the 19th ultimo, and to the representations of the deputation of the Birmingham and District Master Gasfitters' and Ironmongers' Associations, at their interview with the gas committee, I am instructed to say that, after mature consideration, my committee are unable to recommend the Council to comply with your requests (1) that we discontinue the sale of gasfittings, the fixing of gasfittings, gaspipe fittings, and all internal work from the outlet of the meter; (2) that we do not use the show-room for the sale of gasfittings; and (3) that we do not hire out ring burners, grillers, heating stoves (other than cookers), or sell such goods at a less profit than 25 per cent. for the following reasons :—

(*a*) Because the fittings business forms an asset of the gas undertaking purchased by the ratepayers in 1876, and my committee feel that it is impossible to hand over to a section of the ratepayers a property purchased by the whole municipality.

(*b*) Because in the opinion of my committee the fittings business of the department is an adjunct necessary to the convenience of customers, and essential to the development of the undertaking.

The deputation, at their interview with the gas committee, stated that the department was treating them unfairly in competing with them; that a large portion of their trade was thereby taken away, and that it was a difficult thing to carry on their businesses at all; and, in reply, I am requested to say that in 1876, when the gas undertakings were acquired by the Corporation, the annual turnover with private consumers in the fittings branch of the business was 24,320*l.*, and for the five years ended March 31, 1905, as follows :—

1901	£24,271
1902	22,944
1903	24,293
1904	20,384
1905	21,839

From these figures it is apparent that if grave inroads in the business returns of your members are being made, the business so lost is not being secured by this department; but possibly the cause may be found to be due to the establishment of a much greater number of master gasfitters in this district than formerly existed, these being, according to the Birmingham Directory, seventy-five in 1885 and ninety-six in 1905, an increase of twenty-one during the past twenty years. I am also to say that the following conditions apply strictly to the conduct of our business :—1st, we do not advertise; 2nd, we do not canvass for trade; 3rd, we do not tender for work unless requested; 4th, we charge an adequate profit (not less than you mention) on both materials and labour; and 5th, we pay full standard rate of wages for all the labour we employ.

My committee desire me to inform you that in future the rule limiting our trading within our area of supply will be strictly adhered to.—I am yours faithfully,

(Signed) G. HAMPTON BARBER, Secretary.

A NEW EDINBURGH SUBURB.

THE Edinburgh Town Council have recently had under their consideration several new streets proposed to be formed on the Craigentinny estate, extending northwards from Porto-

Are you interested in WOOD PRESERVATION?

Apply to the **ANTHROL** Company, Kinning Park, Glasgow, and you will receive an interesting booklet on the subject, which gives a full account of the remarkable properties of **ANTHROL** and describes the very simple and inexpensive methods by which it is applied. It is an antiseptic preparation which protects any kind of wood impregnated with it from decay in both damp and dry situations, and from the ravages of all wood-destroying organisms in either temperate or tropical climates.

ANTHROL

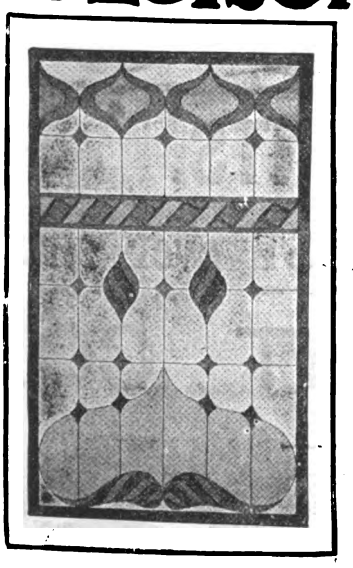
The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The ANTHROL COMPANY, Kinning Park, GLASGOW; and 6 Crosby Square, LONDON.

Digitized by Google

bello Road. This large estate, says the *Scotsman*, is situated within the boundary line of the city of Edinburgh, and is within 15 minutes by car from the General Post Office. It extends from Portobello to Leith, the part at Seafield being within the boundaries of Leith. It bounds the south shore of the Firth of Forth for about 1½ mile, extending southwards to the ancient village of Restalrig. The Portobello Road runs through the estate from Piershill cemetery to where the Figgate Burn passes under the High Street in Portobello. On plans and sections showing gradients, building line and drainage of four new streets, two to the east and two to the west of the farm, being lodged for the approval of the Town Council, the Council asked for a general feuing plan of the estate. This the proprietors of Craigentinny have had prepared, showing in all about 12½ miles of new streets with their widths, &c. This plan the Town Council accepted at their meeting last week. The plan shows nine new streets running northwards from Portobello Road, four to the east of the farmhouse and five to the west of it. A main thoroughfare 60 feet wide will run from near the Gate Lodge on the Portobello Road in a straight line about a mile in length, and meet the road from Leith to Portobello at Seafield at a point where Leith and Edinburgh boundaries meet. A road 50 feet wide will be carried round from Portobello Road to Leith, following the curve of the South Leith Branch railway, while from the Gate Lodge at Wheatfield a street 50 feet wide will run to join the Restalrig Road to the north of the village near the Restalrig factory. A branch of this road will terminate at Piershill station.

Progress has been made with the feuing. More than a third of the frontage on the north side of Portobello Road has already been taken up, and building operations are in progress. Three double villas have been erected, the houses being of the value of 900*l.* to 1,000*l.*, the amount of ground attached to each house being one-tenth of an acre. The ground from the farmhouse westwards is reserved for single and double villas. On the ground to the east of the farmhouse, what are known as flatted villas are presently being erected. These houses sell for about 550*l.*, and each house has a separate entrance, front plot and back garden. On the south side of the Portobello Road one-fifth of the frontage has been feued, and building is shortly expected to commence. The remaining frontage has been reserved for single, double and continuous villas. No tenements will be erected on this road. In the course of a year or two it is expected that Edinburgh and Portobello will be joined by a line of villas. The Westbank brickworks are being removed from their present site at King's Road to the triangular piece of ground formed by the North British Railway main line and South Leith branch and the Fishwives' Causeway, part of the large field between Portobello Road and the Fishwives' Causeway being reserved for the clay field. The present site of the brickworks, which is bounded by High Street, King's Road and the Promenade, is available for feuing, and the frontage to the promenade has already been feued for tenements of half-flat houses, which are to face the sea. The building of these will commence in spring. Feus have been arranged for tenements of workmen's houses facing the High Street. At the Seafield end of the estate feus to the extent of 15½ acres have been given off the part within the boundary of Leith for tenements. Factories and buildings have been and are being erected on this ground, and it is expected that public works will soon occupy the ground bordering on the South Leith and Portobello branch of the North British Railway, from which branch connections can be had.



The part of the estate next Restalrig is available for tenements of workmen's houses and dairy premises. This old-fashioned historical village, with its old church, seen by all railway travellers when passing Piershill station, will soon find itself surrounded by a large population. Within the last three years 150 tenement houses have been erected close to this village, which has existed for a period as far back as the city of Edinburgh itself, being the town of the Barony of Restalrig, which included the town of Leith as far as the Water of Leith and the Calton district in Edinburgh.

Council they were not proud of losing between 30,000*l.* and 50,000*l.* a year on steamers. There were no Corporation steamers on the Clyde. He happened lately—he supposed for his sins and wickedness—to have been upon a Royal Commission upon the traffic of London, and for two or three weary years he had been, as it were, wallowing in statistics, recommendations and schemes. He thought that probably before long Glasgow would have to take up something of the same nature. On the statistics which they must obtain certain broad lines of procedure should be devised. One of the great things that stood out more prominently than anything else in the investigation of London was the inadequacy of the streets for the growing traffic. Probably that had not become so acute in Glasgow as it was in the Metropolis, but one could not help seeing signs that the day was coming when that congestion from which they suffered in London would be felt in Glasgow, if it was not felt already. The first sign of congestion was, of course, the diminution in the speed of travel. In Glasgow, when that excellent system of tramcars began to approach the central area, where everybody wanted to get to at the busiest time of the day, he did not recollect the exact rate of diminution, but he found that in London electric cars which when travelling where the streets were wide and without much congestion realised from 8½ to 11½ miles per hour, when they came into congested streets the speed was reduced to from 5½ to 7 miles per hour. Motor omnibuses which could realise from 8¼ to 11 miles per hour, when they came to crowded parts of the City only realised from 6½ to 8½ miles per hour. There were no cabs in Glasgow now, because the tramways had run them off the road, but in London there were still a great many cabs, and he found that the speed of cabs, which averaged from 6 to 8½ miles per hour where the streets were wide, was reduced to 3½ miles per hour where the streets were congested. These were facts which anybody could get by studying. The loss of speed in cities was not merely a question of the narrowness of streets; it was also a question of the clashing together of different streams of traffic, the crossing of one stream of traffic at right angles or at any other angle with another stream of traffic. These crossings were most vexatious things, and cost quite as much trouble in great cities perhaps as some of the narrow streets. But when they came to look at the thing they saw at once that speed was a necessity of modern life. It was also the case that this affected not only the professional and trading classes, but the working classes a great deal more perhaps than the people realised, because of no class was it more true that time was money. In a very acute sense it was those who were paid weekly wages, and who of course were the bulk of the people whom the corporation of a great city represented, who lost by delay in the traffic. He found that, by taking a calculation of the number of people going to and from their work, and classifying them by Mr. Booth's interesting analysis of trades and occupations, the daily wage bill in London was 700,000*l.* That was the payment made from one class of society to another class of society for the daily work in London. Taking any percentage, however small, upon such an amount of money, it would be seen that the means of locomotion would amply repay itself by the saving of time. As he had said before, in a very acute way time was money, and he thought the Corporation should look at the matter from that point of view. People said that when a railway was made a return was got of 3, 4, or 5 per cent., or whatever it might be, but that if money was spent on a street the expenditure was unproductive. It was far from being that. He ventured to say that in a busy city like Glasgow expenditure of that nature indirectly paid itself over and over again. There was also an important bearing of locomotion on the housing problem in all great cities. He fancied that in Glasgow the working classes resided more within the city than they did in some other great cities, but he supposed that in course of time a very large number would reside in the suburbs, and they would require locomotion. It seemed to him that the housing problem largely depended upon one being able to acquire land at a low rate in the suburbs and to give the working classes cheap means of communication to and from their work. In the central area of London the population was decreasing, while in the zone beyond 3½ square miles of the centre it had increased by 25 per cent. over a term of years. Beyond that again it was increasing at the rate of 45 per cent. Those who required to be housed at low rents must go outwards, and he thought that in many respects it was most desirable that they should go outwards.

URALITE in AUSTRALIA

Messrs. ROBERTSON & MARKS write:—

Pitt Street and Martin Place, Sydney:
4th May, 1905.

Dear Sirs,—In reference to the "Uralite" recently supplied by you for the Criterion Theatre, we have to say regarding the material that it makes a satisfactory covering, is easily fixed, and can be decorated and painted.

We cannot say anything from personal experience regarding its fire-resisting properties, but from what we have read about it we feel sure it is very good in that respect, and economical in price.

(Signed) ROBERTSON & MARKS.

STEEL & IRON ROOFS.

E. F. BLAKELEY & Co.,
CONSTRUCTIONAL ENGINEERS,
VAUXHALL IRONWORKS LIVERPOOL.

GOOD ADVICE.

Architects, Contractors, and others are recommended to journey by the

GREAT CENTRAL RAILWAY.

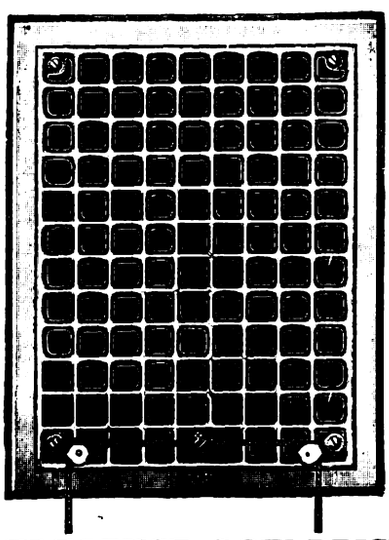
They will find it

RAPID TRAVEL IN LUXURY.

Each Express is VESTIBULED and has a BUFFET CAR attached available for FIRST and THIRD-CLASS PASSENGERS.

The London Express Trains centre on Sheffield, branching therefrom westward to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool; northward to Huddersfield, Halifax, Bradford, Leeds and York; eastward to Doncaster, Grimsby, Hull and North Lincolnshire.

Cross Country Expresses and Through Arrangements with other Companies are a distinct feature of the Great Central services. Liverpool, Manchester, and Sheffield are linked up by corridor trains with Lincoln, Harwich, Lowestoft, Norwich, and the Great Eastern system.

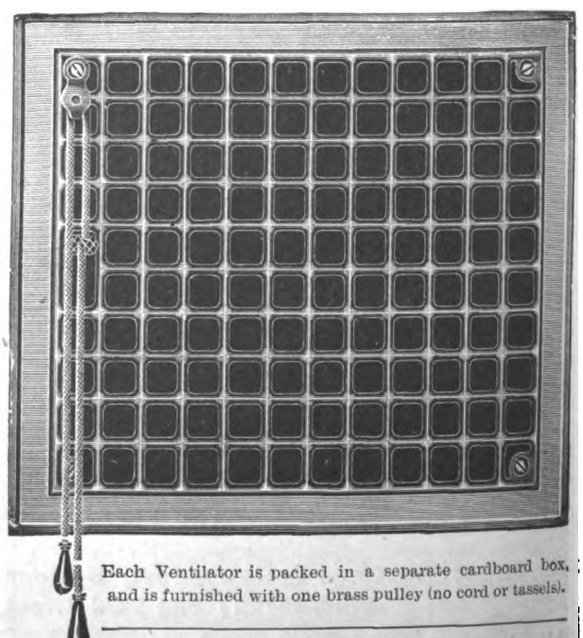


Newcastle, Sunderland, Durham, York, Bradford, Huddersfield, Rotherham and Sheffield are provided with through trains *via* Nottingham, Leicester, Banbury and Oxford, to and from Southampton, Bournemouth and the South-Western Line.

Bath, Bristol, Exeter, Torquay, Kingswear, Plymouth, and the Cornish Riviera are reached by Express Trains from Leeds, Wakefield, Halifax, Huddersfield, Sheffield, Nottingham, and Leicester.

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. off ordinary fares.

The . . .



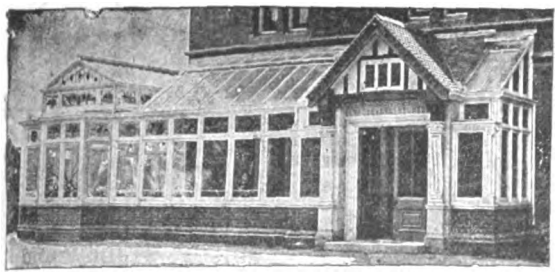
H. & C. Wrought Steel "LOUVRE" VENTILATORS.

MADE IN 130 SIZES.
From 4 × 6 to 24 × 42.

Black Japanned,
White Japanned,
Nickel Plated,
Bronze Plated,
ALSO IN
Solid Wrought Brass
AND
Bronze Metal.

ELEGANCE. LOW PRICE. NO BREAKAGE.
SPECIFIED BY ARCHITECTS.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass pulley (no cord or tassels).



These Ventilators being made entirely of **Wrought Steel,** breakage either in transportation, in stock or in use, is practically impossible.
They are light in weight, with a consequent **Saving in Carriage.**
The Operating Slide is made of very heavy gauge steel, and is especially **strong** to insure against breakage and guaranteeing a free and positive operation.
Each Ventilator is packed in a separate cardboard box, and is furnished with one brass Pulley (no cord or tassels).

Sold by all First-class Builders' Merchants.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

THE whole of the contracts for the new church of St. Chad, Burton-on-Trent, which Lord Burton is presenting to the parish, have been let. The principal contractors are Messrs. Willcock & Co., of Wolverhampton, the builders of Truro Cathedral. It will be of Hollington stone, both inside and out, and will be constructed in the Late Decorated style. The nave is to be 85 feet long and 25 feet wide, and the chancel will be 46 feet by 12 feet. There will be a chapel with a length of 52 feet and a width of 15 feet 9 inches. The church will be provided with a square tower rising to a height of 70 feet. The interior is to be elaborately treated and furnished, the woodwork being of English oak, and the chancel and chapel pavements of green and white marble. The building will seat 750 persons. The plans have been prepared by Mr. G. F. Bodley, R.A.

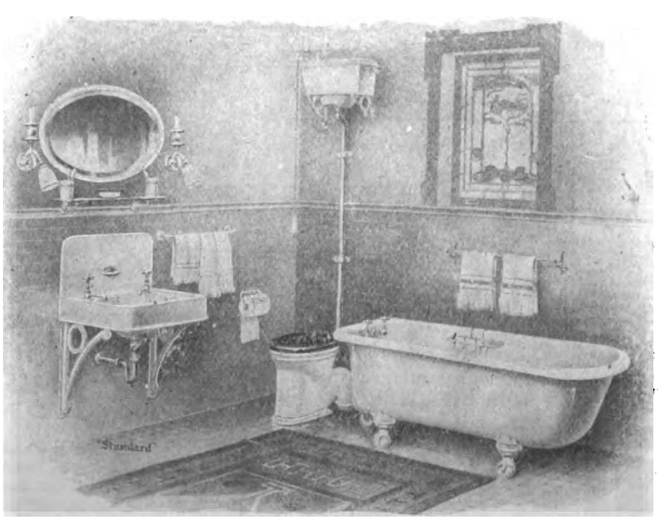
TRADE NOTES.

We have received a copy of Laxton's Builders' Price-book for 1906. There are now two or three price-books issued annually, but Laxton's Price-book still maintains a leading position for conciseness, and no architect or builder can afford to be without a copy. The publishers are Messrs. Kelly, of High Holborn, the publishers of Kelly's Post Office Directories.

The directors of John Oakey & Sons, Ltd., recommend the payment of a final dividend of 5 per cent. to the ordinary shareholders, making a total of 10 per cent. for the year 1905, and in addition a bonus of 5 per cent., free of income tax. They also recommend that 5,000*l.* of the year's profits be carried to the general reserve, raising this amount to 74,000*l.*, making, with the capital reserve, a total reserve of 77,734*l.* 16*s.* 10*d.*, leaving a balance of 3,519*l.* 17*s.* 5*d.* to be carried forward to next year.

VARIETIES.



Applications for the post of surveyor to the borough of Wisbech have been received to the number of 236.

The cost of the extension of the pier at Colwyn Bay is estimated at 20,000*l.*

The Leigh-on-Sea Urban District Council are applying for a loan of 1,000*l.* for the purpose of erecting a foot-bridge over the London, Tilbury and Southend Railway.

One-room tenements are to be included in the housing scheme which the Kensington Town Council are carrying out in their northern district.

Papers will be read at the meeting of the Institution of Civil Engineers on Tuesday next, viz. "A Plea for Better Country Roads," by Mr. G. R. Jebb, and "Country Roads for Modern Traffic," by Mr. J. E. Blackwall.

THE West Sussex County Council will oppose the Portsmouth Water Company's Bill. A sum of 300*l.* will be expended on engaging the necessary professional witnesses.

AT the meeting of the Holborn Council it was decided to hold a limited competition for plans for a new town hall. We understand that six architects will be invited to compete.

AT Messrs. Christie's rooms on Saturday a landscape by Corot, measuring 15½ inches by 12½, was put up for auction. The first bid offered was five guineas, and the picture was bought in at ten guineas.

THE Clacton Urban Council's application for a loan of 2,500*l.*, for the purpose of widening St. Osyth Road and for tar pavements has been granted by the Local Government Board.

THE South-Eastern and Chatham Railway Company have accepted the tender of a Greenwich firm for the old iron that formed part of the roof of Charing Cross station. It is understood that it will be shipped to Italy, there to be used for mixing with inferior iron ore.

THE Whitby Urban Council have approved a scheme for the extension of the harbour piers 500 feet in length, and the provision of a depth of 7 feet below low-water mark. The scheme is estimated to cost 75,000*l.* and was prepared by Mr. Sandeman.

THE Italian Government contemplate carrying out in the course of the next ten years improvements to the existing railways at a total cost of 20,000,000*l.* The scheme includes reconstructing the principal railway stations, doubling lines, and other allied works.

THE Amalgamated Society of Engineers state in their monthly report that there is uninterrupted prosperity at Liverpool, that trade continues to improve in Manchester and Glasgow and is good on the north-east coast, much about the same in London. In Manchester there is not more than 2¼ per cent. of the membership out of employment.

AT the Birmingham Council House on Tuesday representatives of the public works, electric supply, tramways, gas and water companies, as a result of a series of conferences, agreed upon a scheme for the mitigation of the inconvenience arising out of the frequent breaking-up of the streets. The scheme will shortly be made public.

To save the cost of a new school at Farlington, the Fareham education authorities are considering the question of paying the fares of the children and sending many of them by electric cars to Horndean and Catherington, where there is plenty of room. This would cost about 60*l.* a year.

THE annual meeting of the National Provident Institute will be held on Friday next at the Cannon Street Hotel. During the year 1,445 policies were issued, amounting to 601,972*l.* The total number of policies issued has been 78,255, and the present number of members is 27,541. The accounts for the year show a balance of receipts over disbursements of 193,321*l.* 4*s.* 1*d.*, increasing the accumulated fund of the Institution to 6,259,904*l.* 13*s.* 5*d.*

THE Swansea Harbour Trust executive committee have let the contract for the extension of the West Pier 800 feet to Messrs. Topham, Jones & Railton, the contractors of the new King's Dock. An extension of 1,000 feet was made in 1865, and eleven years afterwards of an additional 1,000 feet. The work of extension is expected to be completed in eight months.

NEARLY the whole of the interior surfaces, including the inside of double bottoms, fore and aft, turbine and boiler rooms, bunkers, tank tops, &c., of the two new express Cunard liners being built at Clydebank and Wallsend, are to be coated with patent "bitumastic" enamels and covering. The surfaces in question extend to between 28 and 30 acres on the two vessels.

AT a meeting of the Institute of Sanitary Engineers on the 20th inst., Professor E. C. Coker will deliver an address on "The Flow and Measurement of Water." On February 21 and 28 Mr. N. W. Hoskins will lecture on "Materials Sanitary." On March 6 and 13 Professor Adams on "Supervision of Works in Progress." On March 19 Mr. S. Bartholomew on "Sanitation in South Africa," and on March 20 and 29 Mr. A. E. Abbott on "Heating and Hot-Water Supply."

REPRESENTATIVES of municipalities owning telephone services held a conference at Westminster on Monday. The towns represented were Glasgow, Hull, Brighton, Swansea and Portsmouth. The conference was private, and for nearly two hours those present discussed the means for obtaining from the Postmaster-General his consent to the

renewal of their licenses. The views of the municipalities will be put before the Postmaster General when he receives a deputation.

The London and North-Western Railway Company own the waterworks which supply Crewe with water. They sell the water to the town council, who in turn retail it to the consumers. The Corporation affirm that they lose 1,000*l.* a year by the transaction, and as the railway company will not reduce the price they are engaging experts to conduct boring operations in Staffordshire with a view to securing a municipal supply.

The Associated Portland Cement Manufacturers, Ltd., have placed an order with Messrs. William Beardmore & Co., Ltd., Glasgow, for seven Oechelhauser gas-engines, each of 400 brake horse-power, together with the necessary gas producers of the Mason type, with all gas-cleaning plants and accessories. The plant is for the Swanscombe works of the Association, and will be the first application in this important industry of gas-power plant on a large scale.

A Local Government Board inquiry was conducted on the 9th inst. at the Lincoln Guildhall by Mr. E. A. Sandford Fawcett, M.I.C.E., into the application by the Lincoln Corporation to alter the Lincoln Waterworks Act of 1871 to enable them to borrow further moneys to purchase additional lands for their waterworks undertaking, and to construct new and additional works, including reservoirs at Cross o' Cliffe and Westgate. The amount of expenditure involved in connection with the application was estimated at 100,000*l.*

The Carnegie Watt memorial fund committee have resolved to erect a memorial building on the site of James Watt's birthplace, Greenock, at a cost of 6,500*l.*; 700*l.* had been subscribed in Great Britain and 189*l.* in America, and Mr. Carnegie made up the total sum with interest to 10,189*l.* The site, which is 45 feet by 20 feet, will be occupied by a two-storey building in the old Scots style of architecture, with a statue in a prominent position. Mr. David Barclay, the architect, of Messrs. H. & D. Barclay, Glasgow, prepared four alternative sets of plans.

The Portsmouth Coliseum, Greetham Street, will be erected forthwith, according to plans approved and duly passed by the Corporation, which have been prepared by Messrs. Frank Matcham & Co., architects of the London Coliseum. The new building will be one of the finest and most up-to-date, provided with numerous exits into three separate thoroughfares, constructed on fireproof principles and beautifully decorated and furnished. It will be opened during the year and will have two performances nightly.

The last official act of Mr. N. J. Hayes, previous to his retirement from the post of Fire Commissioner of New York, was to send a communication to Mayor McClellan, urging the abandonment of the present fire-alarm system in the city and the adoption of an entirely new one at a cost of 1,625,000 dols. These figures include the cost of about 500 additional fire-alarm boxes, as well as a new building to be used exclusively as a fire alarm central office. He also recommended that the system be extended to the Bronx.

At the Edinburgh Sheriff Criminal Court sentences were passed on five youths and a girl who had been arrested for extensive thefts of lead, &c., from premises at Leith. One of the prisoners was committed for six months' imprisonment, and the others for three months. The thefts were of a most aggravating nature, and had been systematically carried on. In addition to the actual loss caused by the thefts, serious damage had been done to the property. The extent of the damage was several hundred pounds.

The Cheshire county education committee on Monday accepted recommendations that county secondary schools should be provided at Altrincham (for 200 pupils), Wallasey (for 300 boys), Wallasey (for 250 girls), Macclesfield (for 200 girls), Hyde (250) and Crewe (350 pupils). The estimated cost of the buildings would be 40*l.* per pupil, or altogether 52,800*l.* for the six schools mentioned, and that "higher elementary schools" should be established at Altrincham, Hoylake, Bebbington and Neston district, Northwich and Wilmslow district.

A difficulty has arisen at Southampton between Messrs. Thornycroft, who have large works on the Itchen, and their employés in the engineering trades. The firm contemplate establishing a permanent night shift in the place of overtime, for which they offered time and a quarter. The men, through their societies, demand time

and a half, and a fifty-three hours' week instead of fifty-four. This means a permanent advance of 2 per cent. on wages to the whole of the trades concerned, and would involve a direct loss of 10,000*l.* a year to the firms belonging to the Association.

THE Cheltenham Town Council on the 5th inst. approved of the scheme, submitted by the borough engineer, for removing the Arle and Hatherley tanks and providing sewage disposal works on the Haydon Farm, capable of treating the whole of the sewage of the borough before its application to the land. The scheme includes the provision of detritus and screening chambers, septic tanks and continuous filters, at an estimated cost of 34,385*l.*, and also for constructing a new outfall sewer (3 feet 9 inches by 2 feet 6 inches) from the Arle tank to the site of the proposed sewage disposal works, at an estimated cost of 10,300*l.* Application for the necessary loan is to be made forthwith.

AT the last meeting of the East of Scotland Engineering Association in Edinburgh a paper on "Recent Dock Extension Work" at Middlesbrough was read by Mr. John Robinson, M.I.C.E., the resident engineer on the Middlesbrough dock extension works. Mr. Robinson stated that considerable difficulty was experienced in the excavating, beds of sand and gravel being found between the strata of boulder clay. Underground passages of water burst the sheet piling in several cases, silting up the trenches that were being driven through the clay. Considerable attention was devoted by the lecturer to the construction of the monoliths—huge rectangular masses of concrete which are sunk into the yielding ground. An iron "shoe" is first laid on the ground, and then, by means of a double timber shuttering, a hollow rectangular mass of concrete is built thereon, the walls being from 4½ to 5½ feet thick. When the imprisoned soil is excavated from the interior, the mass gradually settles down. When the proper depth has been reached, the interior is filled with concrete, the whole mass thus becoming monolithic.

THE River Tees Commissioners have entered into negotiations with the Parliamentary agents and the promoters of the proposed conveyor bridge across the Tees and light railway from Middlesbrough to Hartlepool. The promoters agreed that the bridge and railways should form one undertaking, and should be constructed simultaneously; that the bridge should have a clear headway of 175 feet; that the passage of the transporter car across the river should not take more than 1½ minute, and that a five-minutes' service should be established. It was resolved that the clear headway of the horizontal girders crossing the river Tees should be 160 feet above H.W.O.S.T. for a width of 300 feet in the centre of the river, the curve of the headway at each end of the horizontal width of 300 feet to be shown as upon the plan produced.

A LOCAL GOVERNMENT BOARD inquiry was held at Kensington Town Hall on the 6th inst. in relation to a scheme for providing new dwellings for persons of the labouring class to be displaced by the demolition of houses by the Great Western Railway Company with the object of widening their line. Ninety-seven houses and nearly 1,000 tenants are concerned. The company proposed to erect blocks of buildings with suites of two, three and four rooms. The town clerk and the medical officer of health of Kensington urged the importance of providing one-roomed tenements to replace the forty-one tenants who were now occupying single rooms in the houses to be demolished. The Borough Council in its housing scheme had felt the necessity for these one-roomed tenements. They also protested against the proposed higher rents to be charged. Mr. Page said the company would endeavour to meet the wishes of the Borough Council.

BUILDING AND BUILDERS.

THE Clacton Urban Council decided at their last meeting to erect public offices at Clacton-on-Sea, and it was left to the finance committee to obtain a suitable site.

The Association of Master-Painters of Ireland held their eighth annual convention in Londonderry under the presidency of Sir Maurice E. Dockrell. At the opening meeting Sir M. E. Dockrell transferred the president's chair and badge to Mr. William Jordan, of Londonderry.

The Leith Town Council have decided, in view of the facts brought out in the town architect's report showing that the scheme as regards the erection of only one block of cheap dwellings is financially prohibitive, that the whole scheme should be now proceeded with.

The West Hartlepool Town Council have sanctioned further expenditure to the extent of 5,900*l.* for electric-lighting purposes necessary through the increased demand for light and power. It is calculated that no further charge will be made upon the rates in respect of the undertaking.

Mr. T. Roper has been unanimously elected president for the ensuing year of the Sheffield Master Builders' Association. Mr. G. E. Powell was elected senior vice-president, and Mr. T. Eshelby, junior vice-president. Mr. Arthur Mastin was re-elected treasurer, and Messrs. William May and H. H. Hodkin, auditors.

Sir George Meyrick, who is the ground-landlord over a great portion of the cliffs at Bournemouth, has given his consent to the Corporation constructing an undercliff drive from Bournemouth Pier to Meyrick Road, at a cost of several thousand pounds. Sir George has also called attention to the wasting of the cliffs, and has reminded the local governing body of their obligation to protect the same.

Blackburn furnishes what is believed to be the first instance of a woman acting as a clerk of works. The new Prince's Theatre, which was reopened recently, was built by direct labour engaged by the proprietor. His daughter has filled the *rôle* of clerk of works during the reconstruction, exercising general superintendence over the workmen and paying their wages.

The Chiswick Urban District Council submitted for confirmation by the Local Government Board new building by-laws eight years ago. At various periods since communications have been opened with the Whitehall authorities with a view to obtaining their confirmation of the revised by-laws, but it is only recently that their sanction has been notified to the District Council.

The Prestwich Board of Guardians have let the contract for the erection of a new workhouse infirmary at Blackley, according to the plans of Messrs. Thomas Worthington & Sons, architects, of Manchester, to a Manchester firm of contractors, whose tender amounted to 62,000*l.* At the last meeting, before this decision was carried, dissatisfaction was expressed because a tender of 58,000*l.* was passed over.

A new church and schools, St. Andrew's Street, Rugby, was opened on the 14th inst. The complete block of buildings, which comprise church accommodating 700 persons, tower and two-storey school, &c., has been erected under contract by Messrs. Linnell & Son, of Rugby, for 5,881*l.* 8*s.* 3*d.*, from the designs and under the superintendence of Messrs. G. Baines & Son, 5 Clement's Inn, W.C.

The Cape Government Labour Bureau during December received 228 applications for employment. Only a trifle above 50 per cent. of the vacant situations were filled, owing to a lack of suitable applicants, and the reluctance of others to accept work at a low rate of pay; for example, only some half-dozen men applied to be sent to the brick-fields, where forty were required at piecework rates. In another instance, twenty labourers were requisitioned by a Divisional Council at 3*s.* per diem, but no applications were received. The increased demand is unsatisfactory so far as artisans are concerned, a large proportion of the men required being of the unskilled type.

The health committee of the Worcester City Council are actively prosecuting their efforts to clear away the worst of the slum dwellings. They recently obtained orders by the city magistrates requiring certain owners to close their property. One of these, an owner of nine houses, has offered to surrender the whole of the property to the Council if they will undertake, free of cost, to pull the houses down and exonerate him from any action for damages by owners of adjoining property. The committee recommend the Council to accept these conditions, which will enable a very valuable improvement to be effected, and it is not expected that the expense of any work to adjoining property will exceed 30*l.* The Council are also recommended to grant to the committee a general authority to remove insanitary buildings at the Council's expense where the cost does not exceed 20*l.*

AT the Rochester Bankruptcy Court a builder and contractor, of Gillingham, came up for examination, who attributed his failure to undertaking to pull down Jezreel's Tower, Chatham Hill, down to the second-floor joists. He had entered into a contract with the petitioning creditors, who had purchased the property. He was to pay them 320*l.* and take all material and clear out all rubbish. It cost him more to pull down the building than he could get for the material. He was also greatly hampered in carrying out the contract, and he had counter-claimed against the owners for 10,000 bricks thrown down from the top of the building at their request to frighten the Jezreelites so that they would leave the premises. The debtor was allowed to pass.

ELECTRIC NOTES.

THE Folkestone Town Council has decided to hand over its powers to a company to construct tramways on the surface-contact system.

IN consequence of opposition by the Surrey and Middlesex County Councils to the proposal to run electric trams over Kew Bridge, the tramway company announce the abandonment of that clause in their Bill.

MESSRS. BRUCE PEEBLES & Co., having come to terms with the local authorities concerned, will apply to the Board of Trade for a renewal to them of the Light Railway Order granted to the Llandudno and Colwyn Bay Electric Traction Co., on the understanding that they definitely undertake to have the line completed from Colwyn Bay to West Shore, Llandudno, and in operation by the middle of June.

THE London Chamber of Commerce on Monday resolved:—"That this Council, having considered the London County Council electrical power scheme, is of opinion that it is most undesirable, in the interests of the trading and commercial community (and calculated to destroy private enterprise), that the power to supply electricity in bulk should be placed in the hands of the London County Council or in the hands of any private monopoly."

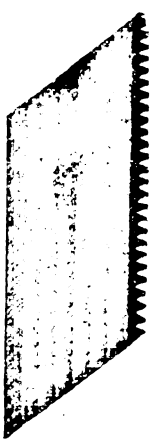
THE Kensington Borough Council on the 12th inst. refused its consent to a proposal of the London County Council to construct a tramway along Church and Silver Streets, leading through the centre of Kensington, regarding it as wholly unnecessary. The improvements committee of the London County Council, before agreeing to recommend the payment of 190,000*l.* towards the widening of these streets, asked for the Borough Council's support to the tramway scheme.

AT the meeting of the North-Eastern Railway the chairman said that the further experience of electric traction on suburban lines in Newcastle had been entirely favourable, both from a practical and financial point of view. In the last half-year of 1903 the company had 2,844,000 bookings by steam traction, and in the corresponding period of 1905 3,543,000 bookings by electric traction. The gross amount carried by steam power was 129,000*l.* and by electric traction 151,000*l.* In 1903 the expenditure in running was 42,761*l.* and in 1905 47,779*l.*, or only 5,000*l.* more to do twice the work. By adopting electric traction on the thirty-one miles of suburban railways near Newcastle the company had practically doubled the train mileage run. The cost for electric traction had been about 6¾*d.* per train mile, as compared with 1*s.* 2*d.* per train mile under steam conditions.

THE parish council of Edinburgh appealed against the valuation of the burgh assessor, which was upheld by the Burgh Valuation Appeal Court, of the electric-lighting undertaking of the Corporation. Their contention was that under section 13 of the Lands Valuation (Scotland) Act, 1854, the electric-lighting undertaking was entered in the valuation roll at other than the just and true amount. The undertaking was entered as of the gross value of 45,269*l.*, which the appellants maintained should be increased to 79,000*l.* Dewar Place station was valued by the assessor at 12,000*l.*, the appellants' contention being that it should be increased to 20,941*l.*; M'Donald Road station, 14,023*l.*, appellants' contention being for 24,472*l.*; and the mains throughout the burgh, 19,246*l.*, appellants' contention being for 33,587*l.*

ELECTRIC steel, *i.e.* steel produced by the electric furnace, is in considerable demand in Lyons, says Mr. Liddell in his consular report. The electric furnace, however, does not replace the blast and puddling furnaces, but is used with greater efficacy in certain refining operations. The production of various iron alloys by the electric furnace,

"MAXIMUM LIGHT GLASS."



LENSES AND PRISMS COMBINED IN ONE SHEET.

ABSOLUTELY THE BEST FOR DAYLIGHTING DARK INTERIORS.

Increases the Daylight from 5 to 20 times.

By reason of a lens surface running vertically on the outside and at right angles to an interior prismatic surface, this glass possesses a double refractory power.

All the light from the sky is gathered, projected, and completely diffused.

The use of the "Maximum Light Glass" lessens the cost of artificial lighting.

Supplied in ordinary window-glass sizes.

Also in ornamental designs in lead or copper.

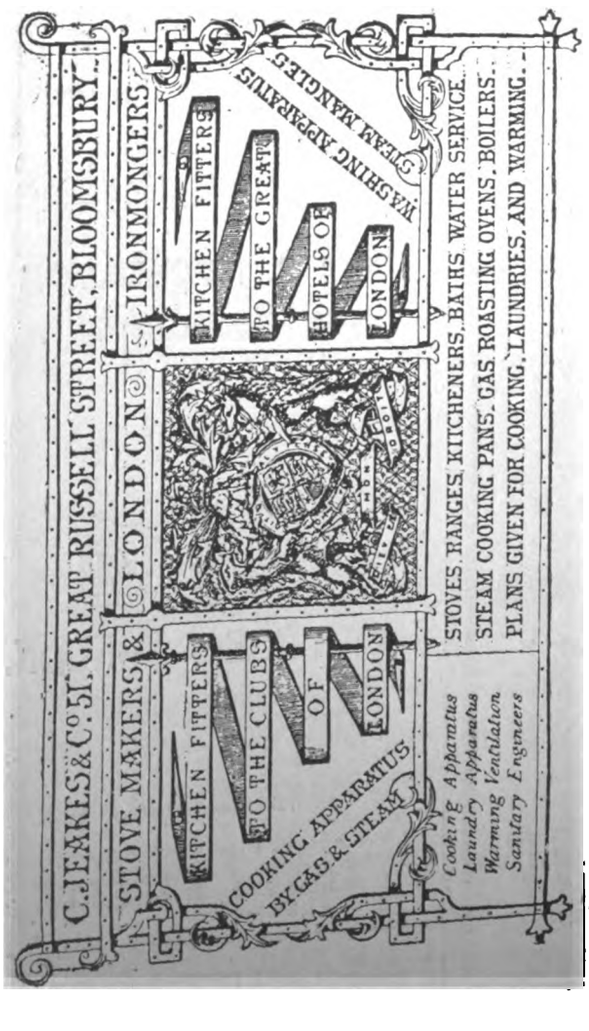
especially of ferrosilicium, has been most active during the past year. Electricity is also extensively employed not only for lighting purposes and motive power, but also for heating purposes, blast furnaces, &c. This industrial evolution also threatens another branch of Lyons industry, the construction of locomotives for light goods and passenger trains. The substitution of electric traction for steam or compressed air seems likely to become more general in proportion as water power for the creation of electric stations becomes available. The electric power produced by existing stations is estimated at 160,000 horse-power for the whole of France.

"DUROLITE."

Questions having arisen as to the nature and purpose of "Durolite," we lately availed ourselves of an invitation to examine specimens thereof at the offices of Durolite, Ltd., 36 Camomile Street, E.C., where a large and varied stock is kept, and where all information on the subject is courteously afforded.

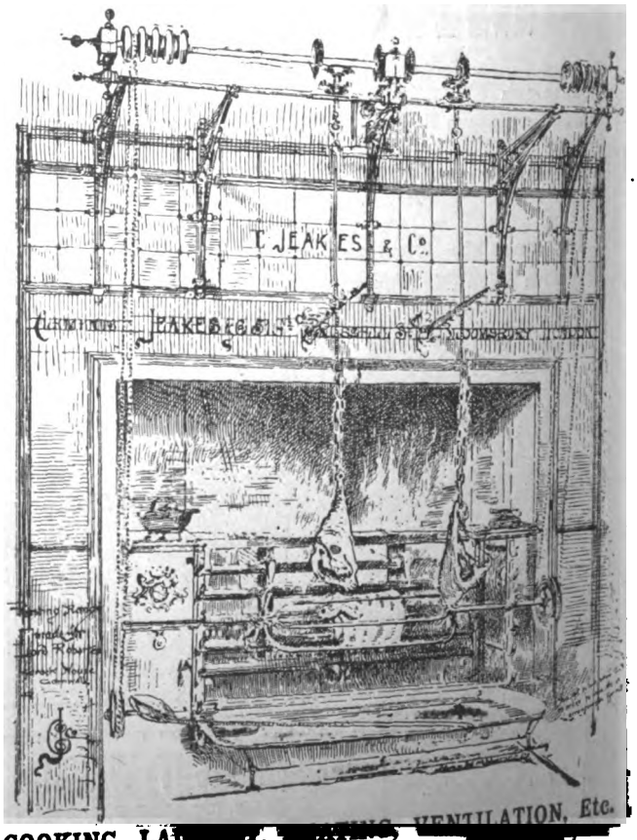
As the name implies, "Durolite" is in the first place a hard and durable material whose strength is, in fact, equivalent to the wall or partition on which the tiling is fixed, and with which it actually becomes incorporated, while there is the further advantage that the surface, although apparently fragile, will withstand the roughest and most violent treatment with impunity, as it does not become cracked or detached even although nails be driven in, which is a sure test of its strength.

The material, with its non-rigid grip or key, is adapted for lining either internal or external walls of all classes of ordinary buildings, and not being influenced by the extremes of either heat or cold, it may with advantage be used in the construction either of a cold storage, Turkish bath or steam bakery. It is an excellent covering, moreover, for damp walls, as the back grip or key is of an absorbent nature, while the surface is non-porous and absolutely impervious. Another important consideration is that there is nothing whatever in the backing, *i.e.* the grip or key, which will tend to assist the flames in the event of a fire, and the tiling can be fixed with any ordinary cement or plaster.



"Durolite" is manufactured in white, plain tinted or any style of decoration that may be desired, in accordance with the designs of architects whose ideas or schemes may be worked out. Any specimens of marbles, granites or other substances can be photographically reproduced on the tiles, so as to resemble in all respects the original, and an unlimited field is therefore open for an artistic and economical as well as permanent wall decoration by means of these tiles, which are made in all sizes up to 24 inches by 12 inches. The process, moreover, which is British throughout, is applicable to general photographic reproductions on either glass, wood, or iron.

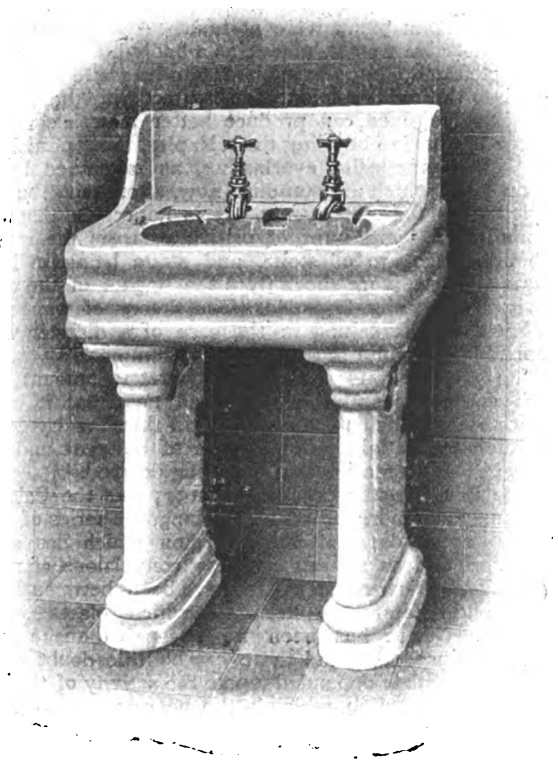
It may also be mentioned that the company are in a position to supply painted figured rolled glass of any design in one, two, three, or more colours, which is eminently decorative and artistic, while it is comparatively inexpensive, and thus affords a wide field for its use where leaded lights are not wanted and stained glass cannot be afforded, filling up the gap, as it were, between ordinary figured rolled and stained glass. Some painted and stained landscapes, photographically reproduced in permanent natural colours, were brought under our notice, and these would serve admirably for vestibules, fanlights, domestic, ecclesiastical and other windows.



Taken altogether, and having regard to its various applications, increasing attention will doubtless be paid in the near future to "Durolite," whether viewed from a utilitarian, æsthetic, or economic point of view.

NEW CATALOGUE.

The catalogue of the Leeds Fireclay Company is a large volume, admirably illustrated and printed on superior paper. Its comprehensiveness is suggested by the twelve sections, which comprise:—(1) Glazed bricks, (2) Burmantofts terra-cotta, faïence and fireplaces, (3) baths, (4) lavatory basins and fittings, (5) sinks, (6) wash tubs, (7) urinals, (8) closets, (9) waste water-closets, (10) hospital and laboratory fittings, (11) stable and farm fittings, and (12) drainage specialties. The beautiful work which is popularly known as Burmantofts, and of which examples are to be seen in London and in all the provincial towns, has gained so much reputation



C. JEAKES & CO., ENGINEERS, 51, Gt. Russell St., LONDON.

COOKING, LA... ...VENTILATION, Etc.

Digitized by Google

as to keep the other products rather in the background. The architectural terra-cotta which is displayed in buildings by Messrs. Waterhouse and other architects has been often described in these columns. But the same care which is

seen in the adornment of buildings can be traced in the smallest products of the company. The effort to produce good form which was equal to express various styles of architecture can be seen even in a scullery sink or in a chimneypiece for a cottage. The catalogue is so comprehensive that architects will find it meets their requirements in the various products for which clay is used. Swimming baths, hospitals, stables and farm buildings are among the varieties of work to which the Leeds Fireclay Company's products are shown to be adapted with peculiar fitness.

BURGLAR AND FIRE ALARM.

AN exhibition was held last week at the First Avenue Hotel, High Holborn, W.C., of Messrs. Carter & Co.'s Burglar and Fire alarm, which is likely to be an important fitting for shops, banks, offices, hotels or private dwellings.

The apparatus consists of an electric battery and conducting wires, one of which is normally interrupted, but has its circuit completed by any attempt at burglary or illicit entrance through a door, window, or other place, the conducting wires passing to a small electro-motor which is set in revolution when the circuit through the wires is completed, and sets in revolution a spindle provided with two opposite cranks, having connecting rods actuating two levers which, as they rise and fall alternately, compress and release two elastic balls communicating with whistles or sound-producing devices when the electro-motor is working, and a switch by which the current can be cut off and the working stopped when desired.

THE establishment committee of the Holborn Borough Council recommend that instructions be given to a firm of auctioneers to sell the town hall in Gray's Inn Road and to spend 100*l.* on advertising the fact. They state in their report:—"This firm advise us, and we agree with their opinion, that it is not a property which would let upon lease. In their opinion, and in ours, the most satisfactory thing would be a sale of the property as it stands, and we are of opinion that, if properly advertised and put before the public, there should be no difficulty in disposing of the same."

BUILDING BY-LAWS.

A REPORT by the rural building by-laws committee was read at a meeting of the Central and Associated Chambers of Agriculture.

The committee stated that the admitted hardships which occurred at the present time were due to the fact that some local authorities, who had adopted the by-laws of 1877, had either through a misunderstanding of their powers neglected, or from the mixed character of their district found it difficult to avail themselves of the 1901 by-laws. The authorities working under the 1877 by-laws had no option but to enforce vexatious restrictions, and the fault lay not so much with the local authorities as with the by-laws with which they had saddled themselves. Out of 668 rural authorities there were seventeen whose by-laws were not based on any model series, and were made before the issue of the first model in 1877. There were 283 who had adopted the 1877 by-laws and 138 working under those of 1901, whilst there were still 246 who had adopted no by-laws at all. In the opinion of the committee that was not a desirable state of things. They could see no reason why the whole country should not be administered under one uniform system, provided such a system were made sufficiently elastic. To encourage the erection of cheap and suitable dwellings for agricultural labourers, and at the same time to protect communities which were gathered together in comparatively small areas of land, they required a great deal of elasticity, a quality not to be found in the existing by-laws. No possible readjustment, either by amending Acts or by administrative powers, could ever place the matter on a permanently satisfactory footing. An entirely new building code was necessary. The committee therefore suggested that a Royal Commission should be appointed to inquire into and report on the subject.

NAPLES AND CALABRIA.

THE British Consul-General at Naples reports that the new dry dock, which has been built to carry ships of the largest tonnage, was nearing completion when, on July 21, one side of it, of the length of upwards of 100 yards, slipped bodily from its foundations into the middle of the dock. This occurrence is forming the subject of inquiry by a Royal Commission, and it seems very likely that it was due to earth movements, as the dock is situated near the foot of Vesuvius, which has displayed unusual activity during the past year. The fact that the constructing engineers were men thoroughly versed in their work renders it very unlikely that their plans were at fault. Added to this, the wall did not give way in places, as a badly-built wall might be expected to do, but slipped bodily in its entire length and broke into three huge pieces on contact with the base of the dock. No place can produce better materials for the purpose of marine building than Naples, the "pozzolana" sand being practically everlasting, as is proved by the Roman piers which are standing now, after being buffeted by the waves for 2,000 years. It is noticeable that these Roman piers were built of bricks, whereas the modern harbour works are of stone, and stone being in larger masses receives more shock from the impact of the waves and is more easily loosened. The theory of wave-shock can hardly be sustained in the case of a disaster which happened as this did in the middle of summer.

The damage was calculated at first to amount to as much as 120,000*l.*, but it is hoped now that it can be repaired for a much smaller sum, and that the dry dock so absolutely essential to the welfare of the port and commerce of Naples may not be very long delayed.

The last disaster of the year 1905 was the Calabrian earthquake, or more properly speaking, the series of earthquakes which devastated that region which has always been more or less subject to these convulsions of nature. The seismic vertical seems to have been between Monteleone and Catanzaro, both of which places suffered severely. There has been no such earthquake in the province since 1728, and there can be little doubt that the one and the other depended upon the activity of the island volcano of Stromboli, which is the nearest volcano to them and is ever in constant activity. Vesuvius was evidently in sympathy, and throughout the summer was in constant eruption, culminating in September, when an important section of Messrs. Cook's mountain railway was swept away. The earth movements at Naples were perceptible only to the delicate instruments at the observatory, but this

immunity was only due to the relief of the mountain afforded by the constant flow of molten lava which issued continuously for months, and is issuing at the time of writing from the north-western, which is always the weakest side of the volcano.

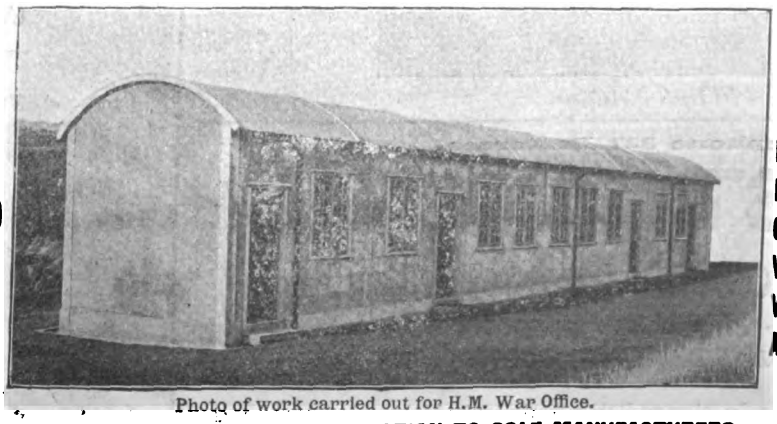
The trade of South Italy has naturally suffered severely from the paralysation of the Calabrias and the general interruption of the various remedies which have been proposed to meet the various social and political problems connected with the position of that unfortunate province. The country is lamentably deficient both in roads and railways. The distances as measured on a map are short enough, but maps do not show the engineering difficulties which have to be overcome in such a mountainous country, as an obstacle which does not appear on a map often involves an expensive bridge or a *détour* of several miles.

The practical result of the disaster will, in all probability, be a largely increased emigration from the Calabrian provinces. A starving population, temporarily housed in what are nothing better than sheds, exposed to the extreme cold of high mountains, all the villages, owing to the malaria of the plains, being perched high on the hills, must seek to better its lot; and the depopulation of the district, already sufficiently alarming to the political economist, is likely to swell the revenues of the emigration shippers.

CONCRETE-STEEL.

At the ordinary meeting of the Engineering and Scientific Association of Ireland held at the Royal College of Science, Dublin, on Tuesday, February 5, Sir Charles Cameron, C.B., president, in the chair, Mr. W. Noble Twelvetrees read a paper on "Concrete-Steel in Engineering Practice." After pointing out that the United Kingdom was the birthplace of Portland cement, and was also the first country to employ this valuable material in connection with iron in structural work, the author remarked that, like many other useful ideas originating at home, the combination of concrete and steel had come back in the guise of a foreign invention, a mistaken view that might account for the distrust with which the material was still regarded by some engineers. Apart from the economy to be secured by the application of concrete and steel in such a way that the characteristic properties of each material could be fully utilised, important savings could be effected in maintenance charges, and notably by obviating the constant cleaning and painting upon which the permanence of ordinary steelwork absolutely depended. Owing to the comprehensive character of the subject represented by the title of this paper, the author found it necessary to select some individual section for attention, and decided that the properties of concrete steel might be generally indicated by describing and illustrating a few typical examples of construction chiefly to be found in the United Kingdom.

Tuckton Bridge, Bournemouth.



The first example taken was that of the new highway bridge rendered necessary by the extension of the Bournemouth system of electric tramways. This is the first concrete-steel structure of its kind in the British Isles, and was built from the designs of Mr. F. W. Lacey, M.Inst.C.E., the borough engineer of Bournemouth. The former bridge on the same site, a timber structure on iron piers, was too narrow for modern requirements and far too light for heavy tramway traffic. Consequently it was purchased by the Bournemouth Corporation, with the object of demolishing and replacing it by more suitable means of cross-river communication. Operations were commenced about April last year, when half of the old bridge was taken down, the other half being used for the conduct of traffic during the operations of the contractors. The total length from bank to bank is 353 feet 5 inches. This distance is covered by twelve segmental arches and two semi-arches, one at each abutment. At the deepest part of the river channel there is a 41-foot 2-inch span, all the other arches having the span of 25 feet 6 inches, the two semi-arches measuring 14 feet 9 inches and 16 feet 3 inches respectively, from the springing to the outer end. Owing to the circumstance that the past summer was free from heavy rains the contractors were able to complete the bridge sufficiently for the official tests, which were conducted in October 1905.

Reedsmouth Bridge, Northumberland.

Expanded metal is a material which lends itself admirably to many types of engineering construction, and as an

Digitized by Google

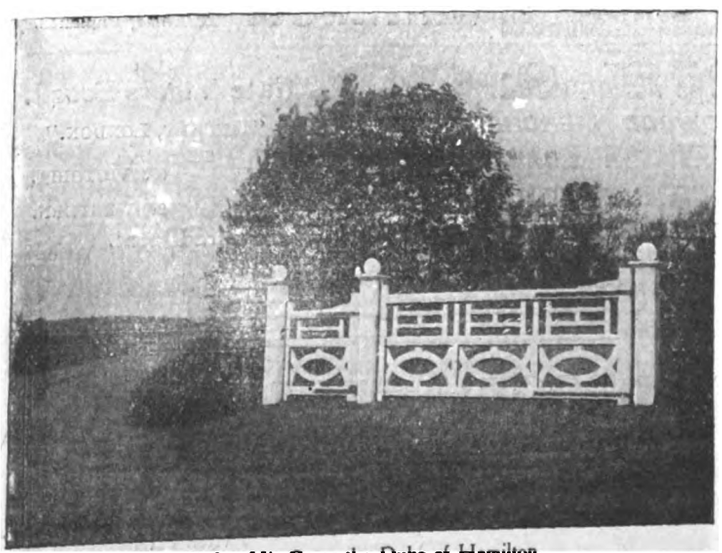
example the author took the bridge at Reedsmouth, a small village on the river Reed. This structure was designed and built for the Bellingham Rural District Council by Mr. John Rule, of Sunderland, whose tender was 15 per cent. lower than the lowest of those for steel girder bridges. The construction is of simple character and quite suitable for the requirements of small country districts, where limitation of capital expenditure is a matter of considerable importance. The bridge includes three girder spans, each of 43 feet. The roadway is 12 feet wide between the parapets, and the platform slab 14 feet over all, and the total length 136 feet from end to end. The floor slab is supported by longitudinal girders, each consisting of a rolled steel joist with one extra flange plate at top and bottom and encased in concrete. Expanded steel passes from the inner side of one girder through transverse joists to the opposite girder. The sheets of expanded steel passing through the concrete were bent to a curve approximately corresponding with the diagram of bending moments, and as the concrete in the girders and slab is monolithic, the whole construction really constitutes a single-ribbed girder. The platform slab is reinforced with expanded metal as in an ordinary floor, and steel rods of small diameter run the whole length of the bridge, so that all parts of the concrete in tension are adequately reinforced.

Transit Sheds, Manchester Ship Canal.

The extensive range of buildings to which attention was next directed comprises five transit sheds, built in connection with Dock No. 9 in the Port of Manchester. These sheds, having a frontage of about 2,250 feet, extend almost from end to end of the quay along the south side of the new dock, and have a uniform width of 110 feet, the whole series being connected by bridges joining the upper floors and the roofs of adjacent buildings. Each shed comprises three floors and a flat roof, virtually constituting a fourth floor. Construction was commenced in July 1903, and finished early last year, about six months in advance of the contract time, the total cost of the sheds, exclusive of fittings and equipment, amounting to more than 150,000*l.* The foundations consist of concrete piers supporting concrete-steel columns, by which all the loads are transmitted directly to the foundations. The walls of the sheds are built entirely of concrete-steel, and, as they carry no load whatever, it was not necessary to make them more than 4 inches thick. The new sheds at Manchester Docks are built entirely of concrete-steel on the Hennebique system, the general designs having been prepared by Mr. W. H. Hunter, M.Inst.C.E., chief engineer to the Manchester Ship Canal, and the details of construction by Mr. L. G. Mouchel, representing the Hennebique patents in this country.

Gennevilliers Gasworks, Paris.

Near the bank of the Seine, on the northern boundary of the plain of Gennevilliers, a large establishment has recently been built by the Société d'Eclairage, Chauffage et Force-Motrice de Gennevilliers, including gas-producing plant, gasometers, storehouses for coal and other materials, a coal wharf on the river front, and a concrete-steel viaduct carrying railway lines for the transportation of coal to the storage depôts. In the paper to which we refer the author dealt chiefly with two concrete-steel storehouses on the Coignet system, which was selected, after due consideration, by M. Stinville, the engineer by whom the general plans of the buildings were prepared.



The building is 45 metres long by 28 metres wide, and comprises two floors and a flat roof, the first floor being 4.40 metres above ground level.

Although far smaller than the Manchester transit sheds already described, the two storehouses at Gennevilliers are interesting examples of reinforced concrete construction, and the fact that they were completely built in the short time of four months by unskilled labourers under the direction of two foremen is one more proof of the advantages offered by concrete-steel for structural work.

New Bridge Street Goods Station and Warehouse, Newcastle-on-Tyne.

This building, now nearing completion, constitutes the most impressive demonstration hitherto available of reinforced concrete construction to railway companies, one of its most noteworthy features being the exceedingly heavy loads carried by the column and floor systems. The magnitude of these may be realised by the statement that, in addition to the dead load, the main floor is designed to carry the moving load of six goods trains, and

to withstand the vibration stresses due to the working of heavy cranes, turntables, and other machinery.

In addition to station accommodation, provision is made on a large scale for warehousing general merchandise and for the storage of flour. The main dimensions of the building are 430 feet long by 178 feet 4 inches wide, by 83 feet 4 inches high from the basement floor to the top of the parapet. The basement is designed for use as a low-level goods station, with four tracks for trains, and ample space for dealing with inward and outward goods. On the ground floor, designed as a high-level goods station, there are six sidings into which trains will be run, and powerful hoists are installed to provide for the transference of trucks from one level to the other. For dealing with merchandise there are provided in the basement two electric cranes revolving around pillars, and two overhead revolving and travelling electric cranes. On the ground floor there are two radial electric wall cranes, two overhead revolving and travelling cranes, as well as turntables and capstans for the manipulation of waggons.

This station and warehouse building was designed by and erected under the superintendence of Mr. W. Bell, F.R.I.B.A., the architect to the North-Eastern Railway Company, in accordance with the Hennebique system.

Reservoir at Newton-le-Willows.

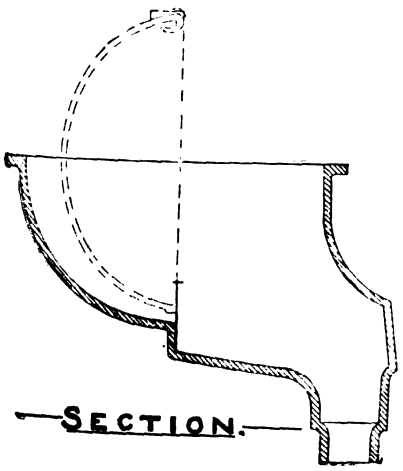
Among the varied applications of reinforced concrete there is none in which the material can be more usefully employed than in the construction of storage reservoirs of different types suitable for the requirements of small districts and of industrial establishments. The new reservoir at Newton-le-Willows forms part of a scheme prepared for the Urban District Council by Messrs. Read & Waring, of Westminster, and receives water from the adjacent pumping station drawing supplies from a deep well. The tower includes a circular reservoir with an internal diameter of 72 feet and a water depth of 12 feet, giving a capacity of 300,000 gallons. This reservoir is supported on twenty-eight columns. The four inner columns form the corners of a shaft which accommodates the inlet and outlet pipes, and contains a cast-iron circular staircase for access to the valve chamber and top of the tank. The remaining columns form two rings, and are connected by radial and circumferential beams of monolithic concrete-steel construction. The central tower passing through the tank rises to a height of 107 feet above ground level, and provides accommodation for the delivery and service mains, and for a stairway leading to the valve chamber above the reservoir. Construction was commenced in July 1904, and completed in October 1905.

This is by far the largest reservoir of the kind hitherto built in this country, and, unlike the hideous water towers to be found in many parts of the country, it forms quite a pleasant feature in the landscape, the only thing detracting from its appearance being the cold colour of the concrete.

The Guillec Viaduct and the Pougastel Bridge.

These examples were taken together because they both represented the system, which is based upon the variety of reinforced concrete devised by M. Considère, Inspecteur-General des Ponts et Chaussées, and described by him as *béton fretté*, or hooped concrete.

The Guillec Viaduct, the construction of which the author was informed commenced this year in the department of Finisterre, France, will include eight bowstring spans of 55 feet 9 inches each, supported on light latticed piers of hooped concrete, the lower ends of which are to be wedge-shaped with the object of permitting the piers to swing to the right or the left as the main spans expand and contract under the influence of temperature variations.



The author also dealt with the Pougastel Bridge, the construction of which is also to be commenced this year in the same department of Finisterre. The most striking features of this bridge are the employment of hooped concrete bow-strong girders, with a span of 317 feet 9 inches, and the manner in which the method of bracing usual in steel girder design has been applied to reinforced concrete. In each of these designs all the tension members are reinforced in the ordinary way, and the compression members in accordance with the Considère system.

A bridge embodying the same principles is now being built at Avarnche in Brittany, in which three types of construction are represented:—(1) A bowstring girder span of 72 feet; (2) two parallel latticed girder spans of 34 feet; and (3) an arch span of 115 feet 6 inches, the total length of the bridge being 256 feet between abutments.

The Renommée Hall, Liège.

In the design of this fine building one great object of the architect was to avoid the employment of concrete merely as imitation stone, and to adopt a design indicating the characteristics and utilising the properties of concrete-steel to the best possible advantage.

The building is about 280 feet long by 93 feet wide. The principal hall measures 154 feet long by 93 feet wide, the main span being 55 feet wide. It is covered by three cupolas, each 55 feet in diameter, commencing at a height of 50 feet above ground level. Each cupola forms part of a sphere, which is continued in haunches pierced with lights and descending to the corner of a circumscribed square. The intersections of the spheres, with the vertical planes passing through the sides of the squares, are formed by arched ribs which spring from the capitals of short cylindrical columns. The cupolas are 4½ inches thick, and are made of clinker concrete reinforced with expanded metal and a latticed arrangement of steel bars.

The hall was designed by M. Paul Jaspar, of Liège, and built by the firm of Parraud et Dumas, Brussels.

Locomotive Depôt at Renens, Switzerland.

A novel application of concrete-steel is to be found in the locomotive depôt built in 1903 at Renens, on the system of the Jura-Simplon Railway Company, near Lausanne. The most recent designs of locomotive sheds are to be found in Great Britain, where, curiously enough, a return has been made to the employment of timber framework, this development at first sight appearing of retrograde character. On consideration, however, it must be recognised that there is some justification for the abandonment of metal work, which, owing to oxidation and injury due to the sulphurous fumes contained in smoke emitted from locomotives, is so rapidly corroded as to involve heavy maintenance charges. On the other hand, the products of combustion tend rather to preserve timber, and to impart to it in some measure the quality of non-flammability.

With regard to the Renens depot, it should be mentioned that Professor Bosset, the engineer consulted by the Jura-Simplon Company, reported in favour of the British type of design, but with the reservation that all parts of the structure usually built of timber should be constructed in concrete-steel.

French engineers have taken much interest in the system of construction here described, and the author believed it to be thoroughly worthy of consideration by railway engineers in this country.

The two preceding examples of construction possess special interest, in view of the attention which has been drawn so much of late to the effects of corrosion upon the iron and steel roofs of railway stations and other buildings.

The roof of the Renommée Hall demonstrates in a striking manner the light and elegant character of the construction rendered possible by the combination of concrete and steel. A roof designed on similar principles for a railway station would lend itself quite as well as a steel structure to efficient lighting, and the span would be further increased if thought desirable for the purpose of reducing the number of transverse intermediate supports in a large terminus. Concrete-steel would obviously be equally applicable to any other type of station design, and the fact that roof principals of more than 100 feet span have been built in America is sufficient to show that the material is applicable for the purpose here suggested.

In conclusion, the author gave the warning with regard to the employment of reinforced concrete, that in addition to the necessity for correct design it was most essential that all the materials for the preparation of concrete to be used in combination with steel should be carefully selected and mixed in proper proportions and in approved manner, and that the arrangement of the reinforcement in the moulds and the subsequent deposition and tamping of the concrete should be performed under thoroughly competent superintendence. Neglect of these points was almost certain to result in unreliable work, and therefore to prejudice the new material in the eyes of professional men and the public alike.

The paper was illustrated by a large number of drawings, photographs, and lantern slides, and among other gentlemen who took part in the discussion which followed were Mr. Hargreaves, assistant engineer to the Great Northern Railway of Ireland; Mr. R. G. Allanson-Winn, M.Inst.C.E.; Captain Purcell, chief of, the Dublin Fire Brigade; Mr. Draper, Mr. Scott, and other well-known Dublin engineers.

Established A.D. 1774.

AUSTIN'S

NEW IMPERIAL PATENT

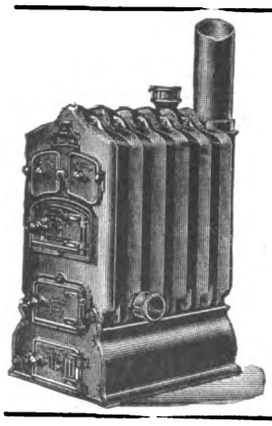
SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy Work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.



N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

Telephone No. 4725 Holborn.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

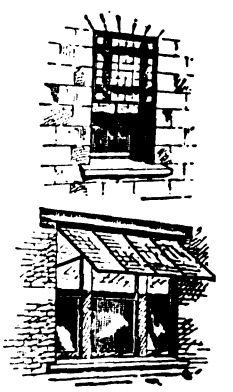
No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.



RIO DE JANEIRO.—May 31.—Plans for the construction of National Congress building. Three prizes of 15,000, 10,000 and 5,000 milreis will be awarded to the three best designs. Particulars can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

SCOTLAND.—March 12.—For a school at Cartsburn, for the Greenock (Burgh) School Board. Conditions, &c., from Mr. A. F. Niven, clerk, Burgh School Board Offices, Municipal Buildings, Greenock.

STONE.—The Stone Joint Hospital Board invite architects residing within the Stone Union to submit designs for proposed isolation hospital. Particulars can be obtained from Mr. J. J. Chapman, clerk to the Board.

WALES.—March 20.—For a free library to be erected in Bangor at a cost not exceeding 3,000*l.*, inclusive of architect's charges. Premiums of 25*l.* and 15*l.* respectively will be paid to the authors of the two approved designs. Premium for successful design to merge into the architect's commission. Deposit 1*l.* 1*s.* Application to Mr. Wm. H. Worrall, clerk to the general purposes committee, Municipal Offices, Bangor, North Wales.

LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS

AN EXPLANATION.—The Luxfer Prism is a flat-backed prism, and is the best for Daylighting dark interiors. The absurdity of any claim to the contrary can easily be demonstrated. Prisms with corrugated backs were patented by the Luxfer Company in 1897, and discarded in favour of a more perfect invention, viz. The Luxfer Prisms, that have been sold in this country during the past six years.

The British Luxfer Prism Synd., Ltd., 16 Hill St., Finsbury, E.C.

Digitized by Google

CONTRACTS OPEN.

A LOCAL GOVERNMENT BOARD inquiry was held on the 6th inst. at Tamworth into the petition of the Tamworth Rural District Council for a provisional order to empower them to acquire, otherwise than by purchase, certain lands at Coton for the purposes of a joint scheme of sewage disposal for the borough of Tamworth. Mr. H. J. Clarson, surveyor to the Rural District Council, said the area which it was proposed to deal with was about 5,700 acres, and the population over 17,000. The site comprised just over 23 acres, and was admirably suited for the purpose. The estimated cost was 23,000*l.* Mr. Midgley Taylor, Westminster, is acting as consulting engineer.

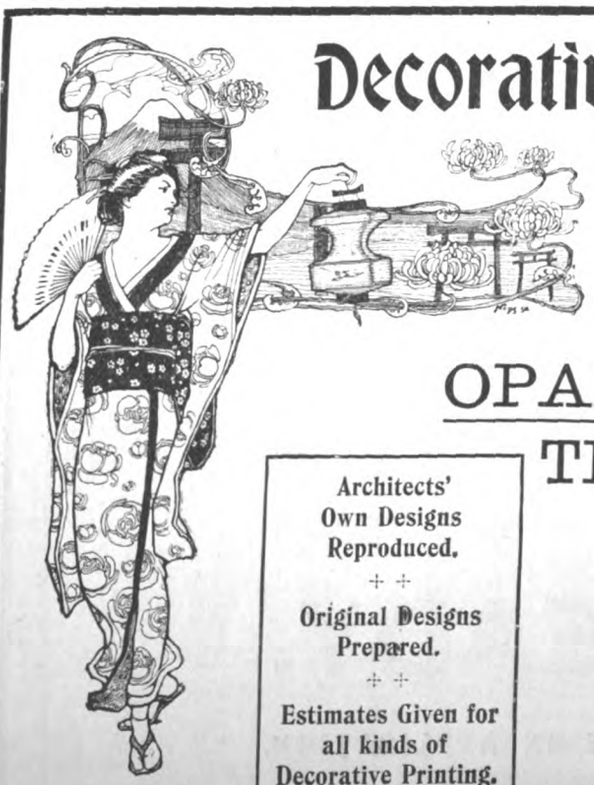
TRADE NOTES.

THE extensions to the Ashton-in-Makerfield hospital are being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues and Manchester grates.

MESSRS. JOSEPH KAYE & SONS, of Leeds and London, have received an order from the Admiralty for 8,100 of their patent seamless serrated oil-feeders, together with a like number of their patent seamless spouts, to be delivered to H.M. naval establishments as may be required. This order is part of a contract which is to extend over the next three years.

MESSRS. BRINDLEY & FOSTER, organ builders, of Sheffield, London and Glasgow, have just erected a large three-manual instrument in Christ Church, Tunstall, Staffs. By the adoption of their latest patented improvements they were enabled to obviate the costliness of any structural alterations, and have successfully installed the organ in an existing chamber on the north side of the chancel. The organist plays from a detached console on south side of the chancel.



MR. B. C. POLE, the patentee of the Momentum engine, has received a letter from Messrs. H. Pontifex & Sons, Ltd., of the Farringdon Works, E.C., in which they say:—"We thoroughly understand the principle of the engine, and the fact of your holding the German patent confirms your claims for the special advantages connected with it. We have long watched with interest the performances of your engine, and have pleasure in stating that our workmen were present at the trial which took place on November 14, 1905, before Professor Sherman and Mr. Harding, when the splendid result you obtained ought certainly to establish all you claim for the engine."

THE HOUSING PROBLEM.

THE second of the series of lectures at the Builders' Exchange, Birmingham, was delivered on the 15th inst., when the attendance was even larger than before. Mr. John B. Whitehouse (president of the Birmingham Master Builders' Association) presided. Mr. F. G. Whittall (president of the Midland Centre of the National Federation of Building Trade Employers) lectured on "The Housing Problem." He emphasised the necessity for the abolition of slums and proper supervision of all property in which the very poorest are compelled to live. By the aid of lantern slides he showed the condition of houses, exteriors and interiors, before and after repairs. He contrasted property in which landlords take an interest with that which landlords neglect, stating that if the landlords take no interest, neither will the tenants. The lecturer compared the conditions which obtain in Birmingham with those which obtain in German cities. In Germany, since the necessity for walled cities has disappeared, building operations have extended outside the city walls. The authorities retain the power to develop the land on definite plans, which embrace good wide roads as main thoroughfares, with narrower roads for intercommunication. They curve the line of the roads as affording rest for the eye, and provide open spaces, the selection of which is governed by the prevailing direction of the wind, to secure an abundant supply of fresh air. Dr. Robertson, medical officer of health, who had accompanied the Birmingham deputation to Germany, suitably proposed a vote of thanks to the lecturer. Mr. Joseph Hill, in seconding, explained how the land had been parcelled out in long strips of garden, upon which the narrow courts had eventually been built. The vote was supported by Mr. W. Sapcote.

MR. H. J. LEANING will on Monday next read a paper before the Surveyors' Institution on "The Assimilation of the Practice of Quantity Surveyors," by the late John Leaning.

THE opening ceremony of the Baptist church, Beverley Road, Hull, was held on Thursday, February 22. The church will accommodate over 1,000 persons, mostly on the ground floor; it is designed in a late period of Gothic, a bold, square tower being the feature at the corner of the site. The contract amount for the church, five vestries, large church parlour, cloak-rooms, &c., is 5,500*l*. The architects are Messrs. George Baines & Son, 5 Clement's Inn, Strand, London, W.C.

ELECTRIC NOTES.

THE schools of submarine mining for Royal Engineers at Portsmouth, Plymouth and Sheerness cease to exist, and schools of electric light are to be established for the corps at these stations in substitution thereof.

THE Dover Corporation decided to purchase additional plant for their power station at a cost of 4,500*l.*, in order to meet the requirements of the contractors for the great national harbour at Dover, who are being pressed by the Admiralty to complete the works by October (a year ahead of contract time).

THE Liverpool City Council have decided to place the tramways and the electric power and lighting undertakings under the control of one committee and to rearrange the staffs of the two existing committees, consequent upon the death of the late tramways manager, Mr. Bellamy. It was stated that a considerable saving would be effected by the combination of the staffs.

THE Castner-Kellner Alkali Co., Ltd., of Runcorn, have resolved to transfer their works to Tyneside, owing chiefly to the fact that on the banks of this river there is a good supply of cheap electricity available. A site has been secured at Wallsend in close proximity to the large power station. This firm produces chemical specialties by the electrolytic process, which demands a large supply of electric power at a cheap rate.

THE Dartford tramways have been completed and opened for public service. The system, which cost 93,000*l.*, provides communication between Horns Cross, near Greenhithe, through Dartford to Bexley Heath, there joining the tramway to Woolwich. The capital was raised by the Dartford Urban Council, who have leased the undertaking to the contractors, Messrs. J. G. White & Co., Ltd., for a term of five years (at the Council's option to be extended to ten or fifteen years), the company agreeing to pay to the Council the capital charges and 20 per cent. of the net profit.

THE Admiralty have decided that the subordinate supervising staff for the Electrical Engineers' Department at Sheerness dockyard is to consist of an assistant electrical engineer in charge, at a salary of 300*l.* on appointment under the non-pensionable scale, and 250*l.* on appointment (if promoted from inspector of electrical fitters) under the pensionable scale, and two inspectors of electrical fitters. The assistant electrical engineer is to be in lieu of the electrical engineer (Mr. Z. H. Kingdon), who has been selected for service at the Admiralty. The drawing staff of the department is to consist of a second-class draughtsman and two mechanics on drawing duties and the writing staff of a first-class and a hired writer.

CONSUL-GENERAL WASHINGTON, of Cape Town, in a report to the Department of Commerce and Labour, Washington, expressed his opinion that South Africa was on the eve of introducing vast changes in its industrial life. He thought that the transmission of electric power would be generated by the mighty rivers of the interior. The question of developing and transmitting electric power from the Victoria Falls was to be considered by a committee of experts. Two engineering specialists to the Victoria Company were inspecting water-power installations in European countries with a view to their application to Rhodesia. America's supremacy in the electrical field should secure the orders for machinery and supplies that will be needed to develop this vast water-power.

THE electricity committee of the Manchester Corporation desire to rearrange and reduce the rates of charge for current supplied for power purposes. At present the rates are complicated. The charge is based upon the number of units consumed per electrical horse-power of the consumer's maximum load, according to a scale which begins with 1¾*d.* per unit in any quarter when the units consumed are less than 150 per horse-power, and ends with 1*d.* per unit in any quarter when the units consumed are 450 per horse-power and upwards. The committee propose that after March 31 the following scale of prices be adopted:—In any quarter when the units consumed are below 300 per horse-power, 1¼*d.* per unit; in any quarter when the units consumed are equal to or are above 300, 1*d.* per unit. The advantages

anticipated from this alteration are a probable increase in sales, a simplification of terms which should conduce to an easier understanding with consumers and the greater popularity of the supply, and a considerable saving in clerical and other work. If the reduced rates as suggested are adopted, it will be advisable, the committee think, to have a minimum charge for power purposes of *7s. 6d.* per quarter, as now charged to lighting consumers, the minimum charge, however, to apply to new consumers only, viz. those connected after March 31 next.

The Secretary for Scotland has given the Glasgow Corporation authority to borrow a further sum of 300,000*l.* for the execution of capital works under the Glasgow electric lighting orders, raising the total sum authorised to be borrowed for that purpose to 1,700,000*l.* The Secretary for Scotland states that he consents to this large extension of the borrowing powers of the Corporation for electricity purposes the more willingly in view of the considerable sums written off for depreciation and carried to reserve fund, particularly in recent years. But with regard to the amount of 885,000*l.*, borrowed under the consents given from 1892 to 1900 and redeemable by means of an accumulating sinking fund of not less than 1 per cent. per annum on the amount borrowed, he says he would view with satisfaction an increase in the provision made for redemption in the direction of assimilating the rate of contribution to the sinking fund for these loans to that made in respect of the later loans, and he trusts that the Corporation may be able to consider this suggestion.

BUILDING AND BUILDERS.

At a meeting of the East Preston Board of Guardians, Sussex, it was reported that applications numbering 121 were received for the post of clerk of works in connection with the erection of the new infirmary, and it was decided to appoint Mr. E. Pentelow, of Preston, Brighton.

The Sheffield and District Building Trades Federation have protested to the City Council against the proposals to close the Weston Park Museum and the Mappin Art Gallery at dusk on Saturdays and Monday, instead of at nine o'clock. The Association also protested against the proposal of the housing sub-committee to let land at High Wincobank on lease. Both communications were referred to the committees concerned.

The works department at County Hall is in a state of jubilation at the present time, says the *City Press*. Mr. Andrew M. Torrance, M.P., the chairman, is able to record a "net profit" of 27,786*l.* in the half-year ended on September 30, the final certificates aggregating 265,103*l.*, and the actual cost working out at 237,317*l.* So far so good, but to regard the 28,000*l.* as an actual saving is absurd. The contractors have been able more than once of late to "undersell" the works committee, but as regards these jobs they were not allowed to compete.

At Ramsey High Court James Cowle, who claimed 500*l.*, obtained 150*l.* damages from R. G. Corkill, builder, for personal injuries to his son, aged nineteen. A rider of the jury was that the money be placed in the hands of guardians until the young man was twenty-one years of age. During repairs to a building an eaves spout fell on plaintiff's son, causing a compound fracture of the skull. For the defence it was contended that all due precaution was exercised.

Mr. G. Ferguson, the oldest master joiner in Glasgow, has died at his residence in that city at the age of eighty-four. Since he set up in business in 1846 he has executed many large contracts, including those for the Coats Spinning Mills, Paisley, the Kelvingrove Art Galleries and the Technical College. On completing fifty years in business in 1896 he was presented with an address by his employés, and a few years ago he was the recipient of his portrait by Mr. James Torrance.

The Portsmouth Master Builders' Association passed the following resolution with reference to the Portsmouth Waterworks Company's Bill at their general meeting:—"That this Association views with great satisfaction the action decided upon by the Corporation of Portsmouth in opposing the above Bill, as, if passed, they consider an unfair monopoly will be created in the building and plumbing trade generally, especially with regard to Sections 6 and 8 of Clause 23 and Clause 26."

The Potchefstroom Master Builders and Contractors' Association have entered a protest against public moneys

CROSLAND HILL STONE, HUDDERSFIELD.

Best Crosland Hill Stone, suitable for all classes of good work, specified by most leading Architects for Church Work and Public Buildings.
Can be supplied in Random Blocks for sawing into Slabs, Panels, Heads, Sills, Mullions, Cornices, or Blocks for Carving, &c.

being expended by local building committees in future, considering it to be more satisfactory for all Government moneys to be spent through the various Government departments concerned, the officials of which, as paid public servants, are more free from favouritism which, either from political, sectarian, or social reasons, is so frequently apparent when these matters are dealt with by local committees.

THE annual meeting of the Association of Master Painters in Scotland was held on the 16th inst. at Aberdeen. The general committee in their report referred to the efficient organisation that existed among the workmen, and urged that not only the members of the Association, but every master painter in Scotland should compare the state of affairs as regards the combination of the operatives compared with that of the employers. It would be well that provision should be made for strengthening the Master Painters' Association financially and otherwise, so as to put it on an equal footing with that of the workmen, because if this was not done the masters would be handicapped in any future trial of strength with their employés. At present the membership of the Association stood almost at the same figure as last year—a little over 200. The committee anticipated an improvement in trade during the coming year.

THE Edinburgh Dean of Guild Court has approved the plans prepared by Messrs. Henry & Maclennan, architects, for the additions on the Royal Blind Asylum and School, West Craigmillar. A new upper storey of stonework will take the place of the present roof storey, and a new top storey will also be added with dormer and pediment windows. The tower will be raised. The dining-hall is to be extended, and the laundry and wash-house, now situated in an outside building, will be placed on the basement floor under the dining-hall, the present kitchen being removed from the basement floor to the new top floor, which will also contain additional dormitories and servants' accommodation. An electric passenger lift from the basement to the top floor and a service lift will be provided. A separate concert-room, apart from the dining-hall, and musical and technical classrooms are also provided for, but they will not be proceeded with yet. The cost of the work will be less than the architects' probable estimate of 15,000*l.*

VARIETIES.

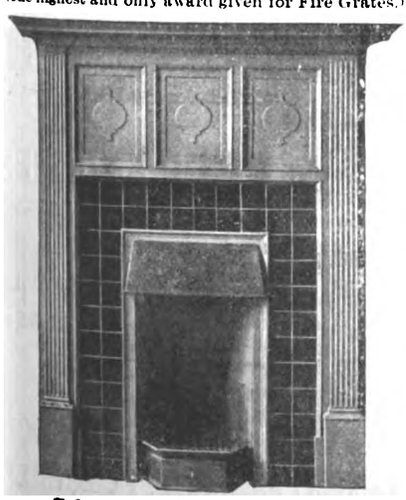
SIR EDWARD SASSOON intends to devote 12,000*l.* to build and endow an orphanage for the sons of soldiers and sailors at Hythe. The locality is not yet fixed, but negotiations are proceeding with the owner of an estate within the borough of Hythe, which includes Folkestone.

THE practice of the late Mr. W. H. Chaney, architect and surveyor, of 37 and 39 Essex Street, Strand, W.C. (and formerly of 30 Essex Street), has been taken over by Messrs. Hukins & Mayell, architects and surveyors, of 76A Westbourne Grove, W., who will continue the practice at the same offices.

THE Stanley District Council are going to make a strong protest against the proposal of the West Riding County Council to take over the control of certain main roads. The opinion was expressed that the County Council are trying to absorb nearly all the powers of the district councils. The Bingley District Council have also decided to oppose the proposal.

THE contractors for the construction of the new deep-water dock upon the Humber at Immingham have been instructed to proceed at once with the first part of the scheme, which includes the making of a light railway between Grimsby and the dock site. Three thousand men will be engaged for four years upon the construction of the dock.

THE seventh and last sale of the Burrage Estate, Kent, took place on the 14th inst. at Winchester House, Old Broad Street, E.C., sixty-four lots being sold for 43,560*l.* The six previous sales (the first was in July 1904) realised 553,450*l.*, so that with the last sale the grand total is practically 600,000*l.* The estate comprised some 3,500 houses, shops and other premises, covering 400 acres, with frontages along 20 miles of streets, the properties being mostly let on leases having various terms now to run at very low ground rents.



THE Maidstone Urban Council have received a notification from Messrs. Wright & Co., of Leicester, whose tender of 41,482*l.* in connection with the new sewage scheme was accepted, to the effect that they made a mistake in their figures, and do not, therefore, feel prepared to carry out the contract at so low a price. At a special meeting of the

Urban District Council in committee on Monday it was decided to communicate with the other firms who tendered, asking them to tender again. The Council have adjourned consideration of the matter.

Messrs. Yarrow & Co., shipbuilders and engineers, Poplar, have acquired land at Scotstoun, within a few miles of Glasgow, to which they intend to remove their works as soon as the necessary arrangements can be made. The site extends to twelve acres, and has a river frontage of about 780 feet. It will provide room for a number of building berths, engine and boiler shops, and also a fitting-out basin. The works will be designed with a view to employing from 1,000 to 1,500 men.

The works committee of the Marylebone Borough Council recommend the carrying out of improvements to carriageways in the West End at a cost of nearly 30,000*l.* These include the asphalting of the wood-paved carriageway in Regent Street, the substitution of wood paving for the existing granite pitching in Market Place from Great Portland Street to Market Court, the relaying of wood paving in Oxford Street from the west side of Edgware Road to Hereford Gardens, and the relaying of the wood-paved carriageway in Edgware Road.

The Dublin Corporation have asked for a provisional order to empower the Corporation to acquire compulsorily certain sloblands at Fairview for the purpose of being used as a place for disposing of street refuse, and for laying out and maintaining a recreation ground. They asked the Local Government Board to sanction for these purposes a loan of 15,500*l.* It is proposed to acquire the whole of the sloblands lying between the high road and the railway, 57 acres in extent, and which is at present covered by the tide at high water, and to close the two railway arches through which the tide flows in and out.

The annual meeting of the Incorporated Institute of British Decorators was held on the 17th inst. in the Sculpture Gallery, Aberdeen. Mr. James Clark, Edinburgh, vice-chairman, presided in the absence of the chairman, Mr. Robert J. Bennett, Glasgow. The chairman, in moving the adoption of the report, said he thought that if there was any part of their business which stood most in need of improvement it was in the knowledge of architecture. Mr. Bennett was re-elected chairman and Mr. Clark vice-chairman.

The Edinburgh Sanitary Protection Association state in their report for the year ending December 31, 1905:—The income of the Association for the year was 2,018*l.* 6*s.* 5*d.* and the expenditure was 1,938*l.* 2*s.* 10*d.*; the figures show an increase in town members during the year, but a slight decrease on the country work. The engineering staff were again fully occupied, and, in addition to the usual local work, several large country houses in England and Wales were examined and reported on. Every town member had the offer of an annual inspection, while many renewed the drainage systems of their houses under the advice and superintendence of the engineers.

At the monthly meeting of the trustees of the Clyde Navigation the new works committee stated that, as the Norwegian firm with which they had been in negotiation did not wish to take the contract for the supply of granite cope for Clydebank Dock, the committee had instructed acceptance of the tender of Mr. A. F. Manuell, being the next lowest. It was stated that foreign granite had always been used by the Trust for this class of work. Mr. Manuell was an Aberdeen man who had opened granite works abroad, and was competing with the foreigner. It would be foreign granite that he would send for this work. The minute was approved.

The Commercial Intelligence Branch of the Board of Trade have received from H.M. Consul-General at Rio de Janeiro an extract from the *Brazilian Review* giving particulars of a competition for the presentation of plans for the construction of a building for the National Congress of Brazil. Projects destined to compete will be received in the Secretarial Department of the Federal Senate up to 4 P.M. on May 31 next. Three prizes, of 15,000, 10,000 and 5,000 milreis respectively, will be awarded to the authors of the best projects presented, and a further sum of 5,000 milreis is to be spent in acquiring projects which, although not awarded prizes, are in the opinion of the judging Commission deserving of being acquired for the National Congress. The text of the programme, in accordance with which projects must be drawn up, may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

THE annual report of the medical officer of health of the Winchcombe Rural District Council states :—The one thing needed in many parts of the district is better cottages for the working classes to live in. They are too small and low-roofed, badly ventilated and too few fireplaces in the bedrooms. I have myself many times had to sit and shiver most of the night in these rooms. There is a general want of comfort and warmth, and very often if they stand back from the road the approach is almost impassable. The staircases are often a marvel of intricacy and snares both to the feet and also to the head. No wonder the young people leave home for something they think will be more attractive, though, perhaps, they go "out of the frying-pan into the fire."

AT the annual meeting of the trustees of the Manchester Royal Infirmary the chairman said that the work of building the new infirmary had progressed in a most satisfactory manner. Indeed, the rate had exceeded their anticipations, and it was gratifying to be able to say there had been no hitch, impediment or difficulty of any kind disclosed. The progress had been so rapid that they had been compelled, in the interests of economy of time, to let a larger proportion of work to the contractor than they contemplated originally. The result would be that they hoped to let practically the main portion of the superstructure to a contractor in April, and it was not too much to say that they might very likely complete the main building in a shorter time than was originally anticipated.

THE Lincoln City Council on the 19th inst. altered their application to the Local Government Board for a provisional order to amend the Lincoln Waterworks Act, 1871, so as to enable the Corporation to borrow, with the sanction of the Local Government Board, the sum of 200,000*l.* instead of 100,000*l.* as appeared in the original application, in case the present boring should be ineffective. With the 100,000*l.* the following work was proposed to be carried out :—The new machinery and buildings at the bore, if their attempts were successful, would cost 30,000*l.*; temporary pumping to test the quantity of water, 10,000*l.*; new reservoir at Cross o' Cliffe, 32,000*l.*; a portion of the new main from Hartsholme and the ballast pits, 3,500*l.*; water tower at Westgate, 7,500*l.*; for engine for deepening ballast pits, 3,000*l.*; new main to Cross o' Cliffe reservoir, 11,000*l.*; new main to Westgate, 5,000*l.*; portion of alteration to filter beds, 3,000*l.*

THE county roads and bridges committee of Warwickshire have resolved, on the recommendation of Lord Hertford, that the county surveyor be authorised to supply a motor cycle at a cost not exceeding 40*l.* to each inspector who will undertake to keep it in good working order and use it in discharge of his duties, the cycle to remain the property of the county, and at the expiration of his engagement to be handed over in good working order, regard being had to the length of time during which it has been in use. Forty pounds per annum was previously allowed the inspectors for horse hire, as a means of seeing that road-mending operations were properly carried out in various places.

A QUESTION of interest to local road authorities came before the Stafford Rural District Council on Saturday. The London and North-Western Railway Company have erected a bridge at Milford to carry the highway over the main line to London. A question has arisen with regard to the repair of the approaches to the bridge. The company's solicitors have written a letter pointing out that Section 23 of the company's Act, 1897, directed that the diverted road, except "the iron, stone and other structure carrying the same over the railway," should be repaired and maintained by the parties liable for the maintenance of other roads in the district, and it was thought that the company's liability did not extend to the roadway. The committee recommended that a case for the opinion of counsel should be prepared, and the recommendation was approved, it being stated that the company's solicitors had overlooked another section.

LORD TWEEDMOUTH, First Lord of the Admiralty, and Mr. Haldane, Secretary for War, received a deputation from the Labour members of Parliament and trade union leaders on the 22nd inst. to consider the question of infringements by Government contractors of the fair wages resolution of the House of Commons of February 18, 1891. The deputation suggested the following as a means whereby firms may be prevented from evading the obvious intention of Parliament in this direction :—(1) No firm should be allowed to do Government work which employs any workman at wages below the recognised trades union rate.

(2) Parliament should be asked by the Government to give a clearer definition or amendment of the fair wages resolution respecting prices and wages, and also to define what is a district within the meaning of such resolution. (3) The Government should enforce all penalties which may be incurred by contractors who fail to comply with the factory clause as inserted in Government contracts re subletting and the giving out of work to be done on the premises. (4) The Government should publish the names of all firms accepting Government contracts.

A PAPER on "Early Eighteenth-Century Architecture" will be read by Mr. J. B. Mitchell-Withers at the meeting of the Northern Architectural Association on Wednesday next.

THE Castlerea Rural District Council have accepted the tender of Messrs. James Gordon & Co., of London, E.C., for the hydraulic turbine, gas-engine and suction plant forming the complete power equipment of their electric-lighting station.

MR. J. F. FOGERTY announces that the partnership between Mr. W. Clifford Parnell and himself has been dissolved, and that he has taken Mr. G. Brumell into partnership. The practice will be carried on as before at Belfast House, Bournemouth, under the name of Fogerty & Brumell.

THE Archæological Society of Glasgow at their last monthly meeting discussed the question of the preservation of the old tenement at the corner of Castle Street and Macleod Street, known as Provan's Lordship, which was one of the oldest houses in Glasgow, if not in Scotland. The house has been purchased with the view of taking it down and erecting on the spot a house for the superintendent of the Royal Infirmary. The President said he knew the house well, and considered it would be a pity to see such an ancient dwelling pulled down. It was remitted to the committee to make inquiry into the matter and take all possible steps to prevent the demolition of the ancient and historic fabric.

THE Lancaster Rural District Council has the distinction of being the only authority of its kind in the kingdom (says a correspondent of the *Manchester Guardian*) that still clings to old-fashioned and cumbersome methods by managing its highway affairs by means of township surveyors, and in spite of the opposition of the Local Government Board and the County Council, it has hitherto refused to change. There are eighteen townships in the district, with 169 miles of parish and secondary roads. These are managed by fourteen "accounting officers," whose total salaries reach 191*l*. At the last meeting a sub-committee of the highways committee reported that the method was unsatisfactory, and recommended that some arrangement be made to secure the work being done more economically and efficiently. The report met with some opposition from farming members, but was eventually referred back to the committee with a request that a definite scheme in place of the present system be presented.

COMPLIMENTARY DINNER TO MR. HENRY ADAMS.

ON Tuesday evening last a large and important gathering of old pupils, who now occupy responsible positions, gathered together at the Holborn Restaurant for the purpose of taking part in a complimentary dinner to Mr. Henry Adams, who has retired from the Professorship of Engineering and Surveying at the City of London College after thirty-five years occupancy, and with the further object of presenting him with a handsome testimonial as a mark of their appreciation.

Mr. J. L. Crouch, who was chairman on the occasion, gave after dinner an interesting account of the steps which led up to the pupils showing their appreciation of what Mr. Adams had done for them. Incidentally he mentioned that he had received shoals of letters from past pupils in all parts of the world, viz. South America, Mexico, Australia, New Zealand and South Africa, expressing their eagerness to take part in the testimonial to Mr. Adams, besides letters from old pupils, including among others the borough engineer for Greenwich, the district engineer of the Crewe Division (L. & N.-W. Ry.), the surveyor of the Kenilworth District Council, the borough surveyor of Beverley, the district surveyors of Hackney and Wandsworth, and the borough surveyor of Tunbridge Wells. There was, in fact, scarcely

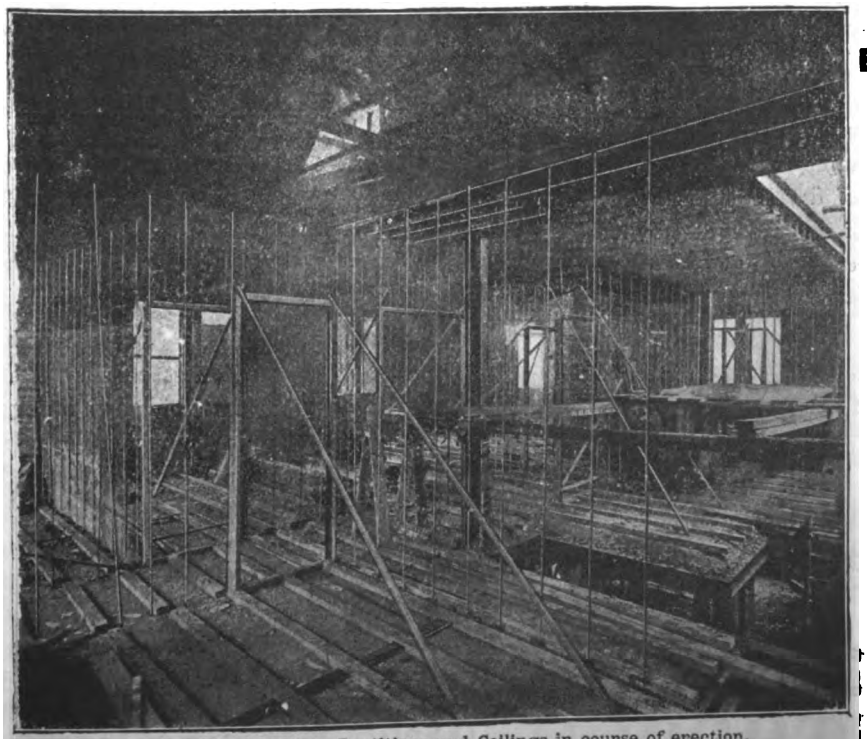
a county of England which does not hold a pupil of Mr. Adams in some official position, besides the countries abroad before mentioned. The Chairman then proposed the toast of Mr. Adams which was drunk with musical honours, and immediately afterwards, in a few well-chosen words, Mr. Brackett said it was his pleasant duty to ask the Professor's acceptance of an album containing the signatures of a number of his pupils, together with a gold watch and chain, and a memento of the very pleasant evening for Mrs. Adams.

Professor Adams said that any words he could use would be quite inadequate to convey his feelings towards his dear old students for their great kindness, and he could only thank them for their magnificent present. It would be a very great pleasure to him to look through the list of their names inscribed in the album and to recall the name, the face and the figure of each of them. Until his students numbered 1,000 he could remember their names and addresses, but when they amounted to between 2,000 and 3,000 he had to limit himself to their Christian and surnames, and when they exceeded that number he had a difficulty in recalling their names, but the book which had been presented to him would serve as a reminder to him, and he should always regard it as a token of good-fellowship to the end of the chapter between his students and himself. He afterwards favoured the company with some personal reminiscences, interspersed with humorous anecdotes, appertaining to his long connection with the City of London College, and added that during those thirty-five years he had given an aggregate of over 10,000 lectures. After his retirement the Science and Art Department wrote to him to come up virtually higher, and appointed him chief examiner of building construction. He had not had much spare time, and was still at work on some of his hobbies. "Never shirk responsibility," and "Hard work never hurt anybody," were the mottoes to be inculcated according to his experience, and he could only add that the memory of that very pleasant evening would never fade. In conclusion he thanked them one and all, and asked them to drink to the health of the Chairman and the committee who had brought them together on that occasion.

The Chairman said that it had been to him a labour of love. Mr. Lambert also responded as a member of the committee, and the rest of the evening was spent in personal reminiscences by several of the old students, among whom present on the occasion were, besides the Chairman, Mr. J. L. Crouch, Messrs. J. Birch, E. G. Boden, A. Burgess, H. E. Chevalier, W. Fraut, S. Fraut, R. E. Ford, A. C. Kells, I. Inkpen, E. Prebble, A. Palmer, F. A. Smith, H. J. Palmer, F. Bates, H. W. Collins, W. Sheen, G. C. Lambert, K. N. Crowther, A. W. Brackett, F. H. Brackett, F. W. Brackett, Ernest Adams, H. E. Adams and V. Inkpen.

EDINBURGH WATER SCARE.



A SENSATION has been caused in Edinburgh by the publication of a statement that some kind of an insect, called generally "a water flea," had recently made its appearance in the house cisterns and in the fire hydrant boxes in the streets. The *Scotsman* says:—The truth seems to be that a few months ago the attention of the Water Trust was directed to the existence of this insect, which is said to live on the top of the water, and the superintendent of works was asked to make an investigation regarding it. He did so, and found that the creature was existent in cisterns in different parts of the city, and also in the fire hydrant street boxes, where it seemed to thrive around the edges of the valve. On these facts a remit was made to Dr. Williamson, chief sanitary inspector, to make a thorough inquiry and to submit a report to the trustees, more particularly on the question of the natural history of the insect and its probable origin. That report will be ready in a few days.

The present inquiry has brought again into prominence the inefficiency, under certain conditions, of what is known as the "ball street hydrant," which was introduced into Edinburgh some thirty years ago. This hydrant is unobjectionable so long as there is water pressure to keep the ball up, but immediately that pressure is withdrawn by want of water from any cause—the turning off the water, for example, to repair a pipe—the ball falls, and the open hydrant is liable to receive any impurities that may have gathered in the iron box in which it is enclosed, and the street covering of which is not either dust or water-tight. The Town Council, who are responsible for the fire

Digitized by Google

hydrants, have for some time been superseding this patent ball hydrant by one which opens and closes by a mechanical key arrangement entirely independent of the water pressure, but as there are something like 3,000 hydrants in the city the process of substituting new hydrants for old has been slow on account of the expense.

In an interview with a representative of the *Manchester Guardian*, Professor S. J. Hickson, professor of zoology at Manchester University, communicated some interesting information on the unpleasant discovery which has been made at Edinburgh of the presence of perceptible living creatures in the public water supply.

"That there should be a scare at Edinburgh," Professor Hickson said, "is not surprising. What is surprising is that a similar scare has not occurred in every large city with a reservoir water supply in the country. Like so many other scares, however, the one that is now allowed to spread in Edinburgh is due to ignorance of some of the first principles of biological science on the part of those who ought to be better informed. There was no more need for a scare on the appearance of 'water fleas' in the water supply at Edinburgh than for a scare at the recent eclipse of the moon. Municipal authorities have been warned that there are biological problems connected with the supply of water to large towns that require investigation, and that a result of such investigation might be the discovery of simple measures for the prevention of such unpleasant alarms as you have just recorded from Edinburgh.

"In 1902 the chairman of our Manchester water committee reported that the pipes were choked with a 'moss' which was not a moss. Now we hear of the members of the Water Trust in the North expressing their opinion that the water fleas are 'insects' and 'worms.' Is it, then, surprising that with such profound ignorance as this exhibits on the part of those who should be our authorities on the simple scientific features of our water supply, we should be threatened with alarms and scares?

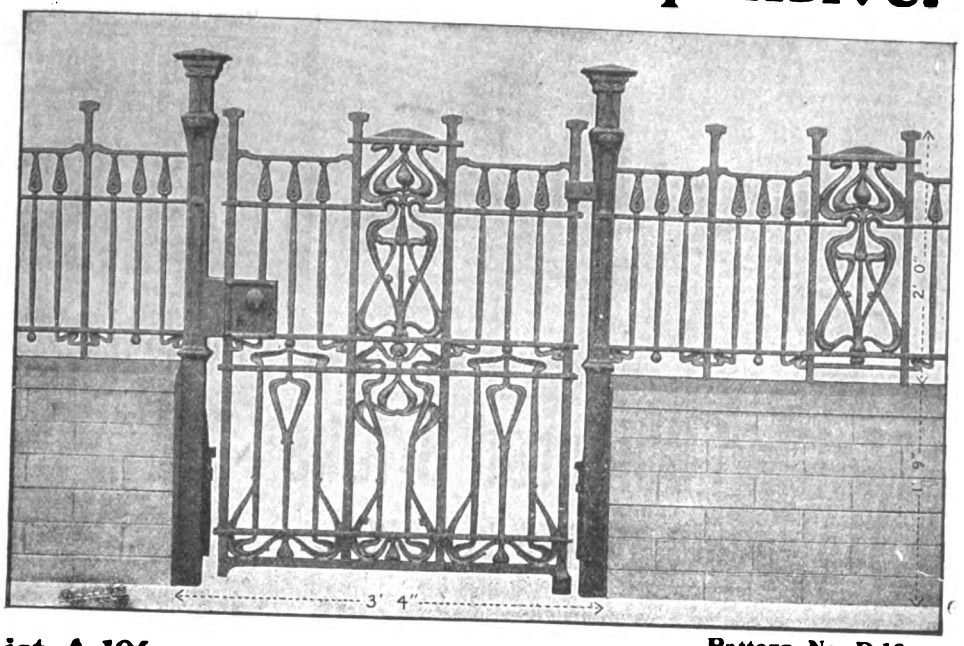
"There is no need whatever for an expensive commission of inquiry. The main features of the life history of all these so-called 'water fleas' are well known, and a commission (of the usual type) would probably waste a great deal of time and money in repeating observations and experiments that have been made before. The principal need is that one or more of the water bailiffs should have a training in some simple methods of microscopical work, so that they may be employed as 'watchers' for certain natural phenomena connected with the fauna of large sheets of water. The water bailiff employed as a 'watcher' should report to headquarters when certain phenomena appear, and the headquarters staff should be in communication with zoological authorities when their advice is necessary. Such advice, I may here remark, is always given willingly and without cost to the authorities. As things are at present, here in Manchester and elsewhere, the advice of those who can advise on these matters is not sought, and too often when it is offered is ignored or refused.

"These creatures which have appeared at Edinburgh are neither fleas nor worms. They are fresh-water crustacea. In the early spring they swarm, that is to say, they collect together in immense quantities. They put on bright colours, and they have often been mistaken by the superstitious for streaks of blood in the water. These swarms can be watched. If you have a competent water bailiff, who has his eyes open, all that has to be done is to prevent the swarm from getting into the pipes—the creatures are pretty stationary; they do not migrate very quickly, and if you see them getting towards an exit stop that exit. If proper care is exercised in the reservoirs that are being used there need be no danger of these things getting into the pipes in such numbers as to be an inconvenience or a trouble to the consumer."

Professor Hickson added that a specimen he had seen, taken some time ago from the Manchester water supply, was from an eighth to a quarter of an inch long. "In the year 1895," he continued, "there was a scare of a similar kind at Burnley, due to an increase in the number of water snails (*Limnæa peregra*) in one of their reservoirs, which gave the water an unpleasant smell. It was proposed that a new reservoir should be built, but a suggestion was made by a zoologist who had knowledge of the life history of this snail, who recommended that a simple alteration in the constitution of the banks of the reservoir would remedy the evil. This suggestion was carried out. I wrote a year or two ago to inquire if there had been any recurrence of the mischief, and was told that the authorities had had no further trouble."

Are you interested in WOOD PRESERVATION?

Apply to the **ANTHROL** Company, Kinning Park, Glasgow, and you will receive an interesting booklet on the subject, which gives a full account of the remarkable properties of **ANTHROL** and describes the very simple and inexpensive methods by which it is applied. It is an antiseptic preparation which protects any kind of wood impregnated with it from decay in both damp and dry situations, and from the ravages of all wood-destroying organisms in either temperate or tropical climates.



ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

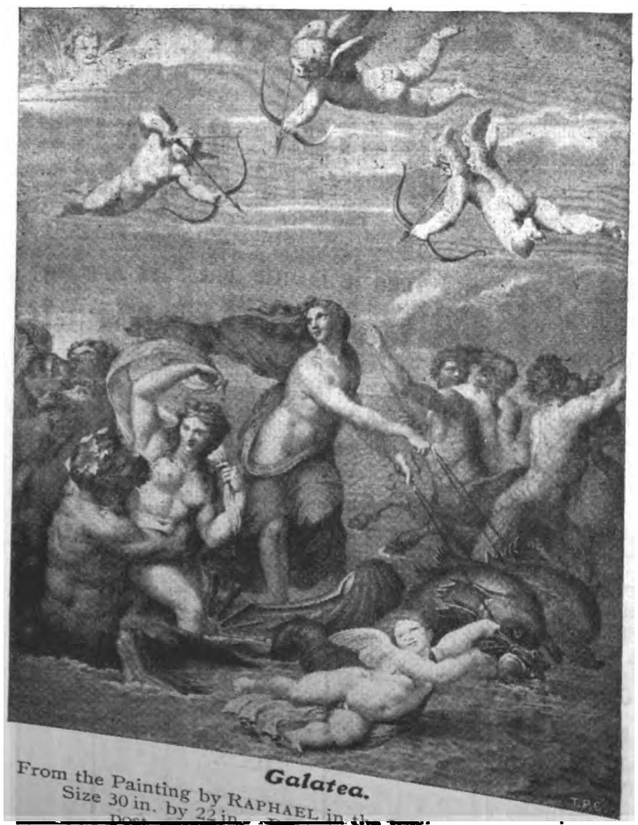
Art Plates from "The Architect."

AWARDED GOLD MEDALS, INTERNATIONAL HEALTH EXHIBITION AND ARCHITECTURAL AND BUILDING TRADES EXHIBITION (1888).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for framing.



***The Corn Field.*—(1) Ploughing; (2) Harrowing; (3) Mowing; (4) Carting; (5) The Products of the Corn Field.**

In Five Separate Plates. Total Length, 14 ft. 7 in. by 15 in. deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT," in 1886. A few proofs were taken which immediately became out of print.

OPINIONS OF THE PRESS.—"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition has been issued."—*The Lady's Pictorial.* "They are beautifully done in colours by the permanent ink-photo process and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage.* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour work in permanent ink photo by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic and would grace the walls of any house."—*The Gentlewoman.* AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates they have been reproduced by Subscription at Half a Guinea the Set, free by post, carefully packed inside patent roller, and are now ready for issuing. Immediate application is requested. May be had framed in Black Reeded Frame with Gold Mounts, price Three Guineas the Set of Five Pieces.

Galatea.

From the Painting by RAPHAEL in the Villa Farnesina, Rome.
Size 30 in. by 22 in. Price Two Shillings. Free by post, carefully packed inside patent roller.

St. George.

AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.
The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy Work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.
AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.
They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.
N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

AWARDED SILVER MEDAL, SANITARY INSTITUTE, 1902.

THE BRITISH SANITARY CO.'S
NEW AND IMPROVED SELF-ACTING EARTH CLOSET.

HIGHEST AWARDS:
Birkenhead, 1881; Newcastle-on-Tyne, 1882; Glasgow, 1883; Dublin, 1884; Plymouth, 1885; Edinburgh, 1886; Glasgow, 1887; Haddington, 1892; Liverpool, 1894; Newcastle-on-Tyne, 1896.

For Simplicity and Efficiency their Closet stands alone.
Medal from the Society of Architects, London, for superiority of workmanship and materials used in manufacture of Closets.

ITS ADVANTAGES ARE:—
1ST. The simplicity, strength of the mechanism, and non-liability to get out of order. 2ND. It is self-acting. 3RD. The effective distribution of the deodorising material thoroughly covers and absorbs all offensive matter and smells. 4TH. The large capacity of the containing magazine holding the earth or other deodorising material. 5TH. The very moderate price it can be sold at as compared with other closets not even possessing the above advantages.

PRICE LIST AND FULL PARTICULARS SENT ON APPLICATION TO
THE BRITISH SANITARY COMPANY, 341 BATH LANE (at Charing Cross Station), NORTH STREET, GLASGOW.

DOULTON'S Patent Isolated Trough Closet
WITH SYPHONIC ACTION No. 333.
Fitted with Cast-iron Closet Screens Glass Enamelled or coloured Vitreous Enamelled.

For Schools,
Barracks,
Factories, &c.

In manufacturing this pattern, three or four important points have been borne in mind, viz.:—
The isolation of each person.
A large surface area and depth of water in the basin.
A good flushing rim, by which the whole interior surface is thoroughly cleansed when the cistern discharges.
A tank arrangement that allows a large aftercharge supply.

Doulton's Patent Automatic Regulator for controlling the discharge of flushing tanks in connection with Trough Closets can also be supplied.

THE

Architect and Contract Reporter.

FRIDAY, MARCH 2, 1906.

Published weekly, subscription 19s. per annum for Great Britain, and for Colonial and Foreign subscriptions £1 6s. 6d. All business communications to the Managing Director,

P. A. GILBERT WOOD,

Publishing Offices, 6-11 Imperial Buildings, Ludgate Circus London, England.

**** Entered in the United States of America as second-class matter. Agents for America, The International News Co., 5 Bream's Buildings, Chancery Lane, London, England, and New York.*

Important Notice to the

Architects and Civil Engineers of Westminster.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Ltd., to establish Branch Offices in that district at 43 OLD QUEEN STREET, S.W., *Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.*

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

The Birmingham Offices are at 102 COLMORE ROW.

AGENTS FOR THE COLONIES.

MESSRS. GORDON & GOTCH,

Melbourne, Sydney, Brisbane, and Perth, Australia; Wellington, Christchurch, and Auckland, New Zealand; Launceston and Hobart, Tasmania.

SOUTH AFRICA—*Central News Agency, Ltd.*

Telephone No. 4725 Holborn.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

RIO DE JANEIRO.—May 31.—Plans for the construction of National Congress building. Three prizes of 15,000, 10,000 and 5,000 milreis will be awarded to the three best designs. THE Bridgend District Council have decided to dispense in June next with the services of a sanitary inspector. Some opposition has been aroused, and the Bridgend branch of the Amalgamated Society of Railway Servants recently passed unanimously the following resolution:—"That this branch recognises the good work done by the sanitary inspector of our town. Two hundred and fifty house connections have been examined and 200 found to be out of order, which goes to prove that the drainage of our town is in a deplorable insanitary condition, and that a sanitary inspector should have been appointed years ago. We appeal to the District Council to reconsider their retrograde action in deciding to dispense with the sanitary inspector, and ask them to retain his services permanently, believing that the health of our town should be considered in preference to pounds, shillings and pence."

TRADE NOTES.

THE Queen Victoria Memorial Hall, Singapore, is now nearing completion, the final contract for a large clock and peal of bells having been placed with Messrs. Gillett & Johnston, of Croydon, Surrey.

THE Otis Elevator Company, Ltd., have been awarded the contract for six electric passenger elevators on the City and South London Railway Company's extension to Euston. There will be four elevators at the King's Cross and the St. Pancras stations and two elevators at Euston station.

MR. N. LINDSAY FAWCETT, who has been for some years one of the proprietors of our contemporary the *Stone Trades Journal*, has recently resigned his connection with that publication to take up the special representation of the well-known firm the Marmor Company, Ltd., of Finsbury Square.

MESSRS. HEENAN & FROUDE have commenced the erection of a destructor at Clydebank for the Town Council. After a lengthened period of consideration and numerous visits to places where various systems of refuse destroying could be seen in operation, the Council decided some months ago on the back-feed system, and have also given the contract for the clinker-crushing machinery and the mortar-mill, which completes the scheme.

THE contract for the new roof of Charing Cross railway station has been placed by the directors of the South-Eastern and Chatham Railway Company with Messrs. Mellowes & Co., of London and Sheffield, for their Eclipse system of glazing.

ELECTRIC NOTES.

THE watch committee of the Coventry City Council were on Tuesday instructed to consider and report upon the cost under the present arrangement of lighting the streets by electricity and also what annual saving would be effected by substituting gas for electricity.

THE Stoke-on-Trent Town Council intend to apply for sanction to borrow 5,745*l.* required for the purchase of additional electric plant. During last month the electricity supplied showed an increase of 83 per cent. over the corresponding period of last year.

THE Board of Trade has conceded to the Llandudno and Colwyn Bay Electric Traction Company an extension of their powers for one month from this date. This is presumably to enable Messrs. Bruce, Peebles & Co., who have a provisional agreement to take over the line and complete it, an opportunity of completing the negotiations with the local authorities and landowners.

THE Kensington Borough Council on Tuesday resolved to present a memorial to the Prime Minister and the President of the Board of Trade asking for the appointment of a Royal Commission to consider the whole question of the supply of electricity in London, and that, pending the report of that commission, all the Electricity Bills introduced or intended to be introduced in the present session be suspended.

THE utilisation of waterfalls for electric-power stations has been adopted at Fort William, a rapidly thriving town of Western Canada. According to a correspondent of the *Manchester Guardian*, the most interesting public work which is being pressed forward is the utilisation of the falls of Kaministiquia river for the generation of electric power. About fourteen miles from Fort William are the Kakabeka Falls, with a drop of 120 feet, or, including the rapids, which stretch for a mile along the river above the great falls, of 160 feet. As the station will be located at a point 20 feet below the lower level at the great falls the turbines will receive their power with a total head of 180 feet—very little less than that of Niagara. The river will be tapped at the head of the Ecarte Rapids, and the aqueduct of 10 feet internal diameter will lead to a steel and concrete reservoir, from which will lead the turbine service pipes. Each turbine will develop 7,000 horse-power, and immediate provision is being made for 14,000 horse-power, which can be increased, if required, to double the quantity. The constructing company is sanguine about the completion of its gigantic undertaking by June 1. The main aqueduct can be used to its fullest capacity without any appreciable effect on the river or the grandeur of the great falls.

VARIETIES.

THE Buckley Urban Council has concluded an agreement with Mr. Eayrs, a Birmingham engineer, for the carrying out of a drainage scheme for the district at a cost of about 10,000*l.*

THE Essex education committee on Monday approved of estimates for new schools and alterations to be carried out during the ensuing year amounting to a total expenditure of 75,000*l.*

MESSRS. CHARLES NELSON & CO., LTD., of Stockton, near Rugby, installed gas-power in their cement works with so much success eighteen months ago that a plant of 600 brake horse-power is now being put down.

THE Wesleyans of Sheffield have determined to proceed with a scheme for the erection of a central hall at a cost of 38,500*l.* The plans have already been adopted, and tenders will be invited as soon as possible.

A MISSION HALL is to be erected in connection with St. Mark's Church, Portobello, N.B., according to plans prepared by Mr. Edward C. H. Maidman, architect, Edinburgh.

THE Preston Town Council have directed the attention of the cotton manufacturers of Preston to the fact that drains were being choked up by cops and cotton waste from mills in the town; in fact, the amount of cotton totalled about a ton per week.

THE medical officer of health to Galway Urban Council reported that on visiting Munster Lane, which is situate almost in the centre of the city, he found in a house, which contained only one room and a kitchen, no less than fourteen adults of both sexes, a baby, two dogs and a couple of donkeys.

DESIGN FOR A COUNTRY RESIDENCE, WITH STABLING AND A FORMAL GARDEN.

THE works of Messrs. Johnson & Phillips, electric engineers, at Old Charlton, were partially destroyed by fire on Tuesday last. The loss is estimated at over 30,000*l.*

THE Peel Town Commissioners offer the sum of 10*l.* for the best set of plans and specifications of a building to be erected in Castle Street, Peel, not to cost more than 500*l.*, which is intended for public reading-room and library, with caretaker's residence on the premises. Plans to be submitted before the 17th inst.

THE Nottingham education committee recommend the erection, on the site in Stanley Road, of a school for 480 infant and junior scholars, and of a centre for technical instruction; and also for the completion of the Sneinton-boulevard scheme by the erection, on the Sneinton-boulevard site, of a school for 780 senior boys and girls. The estimated cost of the three projects is 24,400*l.*

THE special committee of the Manchester City Council appointed to consider the question of a proposed works department are to obtain further information on the subject from the London County Council and the Corporation of Battersea before the holding of another meeting, and a deputation of four members of the committee has been appointed to interview these authorities.

A ROMAN Catholic church was opened on Saturday in Brighton Place, Portobello. It consists of nave and sanctuary, with apsidal end measuring 112 feet by 27 feet wide, a north and south aisle, each 14 feet wide, terminated by altars. The main façade has a tower 130 feet high and a baptistery. The cost has been 13,000*l.* The designs were furnished by Mr. J. T. Walford, architect, Portobello, near Edinburgh.

THE fire-brigade sub-committee of the Glasgow City Council have directed the attention of the Corporation to the large percentage of fires due to defective construction in properties erected prior to the Building Regulations Act, 1892. During the four weeks ending February 13 the number was thirty-one, while only one fire attributable to this cause occurred in a building erected after 1892.

A PLUMBER engaged on a house in Edinburgh fell from the height of five storeys while at work at Warrender Park Crescent. Doviet was being hoisted up by a pulley and sling when a knot of the rope gave way. Fortunately his fall was broken by a meat-safe which he struck. He was taken to Edinburgh Royal Infirmary, where it was found that he had bruised his legs, but had received no serious injury. He was able to walk home.

NOTICE has been given that at an early meeting of the London County Council the education committee will be asked to confer with the other committees of the Council concerned, and to report as to the desirability of arranging for a limited number of scholars to be received as apprentices in the various departments of the Council, and to be given facilities for attending technical classes during ordinary working hours, so that such apprentices may be trained as efficient engineers, carpenters, builders, or cabinet-makers, or in such other trades as may offer opportunities for training.

THE main drainage committee of the London County Council report that the northern low-level sewer is carried over the East London Railway at Shadwell in an iron tube supported on wrought-iron girders, which, owing to the emission of steam and smoke from passing engines, have after forty years undergone considerable deterioration. In its present condition the sewer at this point is a possible source of danger to the public, and they think that the sewer should be diverted and carried over the railway at a point where it would be practically safe from corrosion. Next week the committee will ask permission of the Council to accept an offer by W. Kennedy, Ltd., at 11,235*l.* for the reconstruction of this portion of the sewer.

AT the Guildhall, Rochester, Major J. Stewart, R.E., one of H.M. inspectors from the Local Government Board, held a public inquiry into the application of the City Council to

borrow a sum of 35,000*l.* for the purchase of land and property for street improvements under Section 64 of the Rochester Corporation Tramways and Street Improvements Act, 1903, in addition to the 69,888*l.* which the statute authorised, the cost of acquiring the various properties having much exceeded the Parliamentary estimates; but a very large sum will come back later on by the resale of land upon the frontages purchased for widening streets and making a new road.

MR. JUSTICE BRAY delivered judgment in Liverpool recently in the action Wallasey Urban District Council *v.* Walker, which was against the defendants as owners, within the meaning of the Council's Act, of certain property in Belvidere Road, New Brighton, to recover the sum of 164*l.* odd as the defendants' proportion of the cost of certain street improvements. The defendants had been served with notice of apportionment, and had made no objection within the specified time, and the work was done. The defendants then discovered that they were not owners of the frontage to Belvidere Road, and on that ground pleaded exemption. Mr. Justice Bray has held that under the powers of their local Act the Council could require notice of objection within a specified time, and this notice not having been given, the defendants were liable.

THE Board of Trade *Labour Gazette* gives some preliminary figures on the subject of "Trade Disputes in 1905" which are open to revision in the annual report. The article says:—"The comparative freedom from trade disputes which has been noticed for some years past continued in 1905. While, however, the amount of industrial disturbance, as measured by the aggregate duration of the disputes, was less last year than in any of the ten years 1893-1902, it was considerably more than in 1904 and somewhat more than in 1903. The number of disputes recorded as commencing in 1905 was 337, affecting 92,768 workpeople, while the aggregate duration of all disputes in progress during the year was 2,446,271 working days. The number of workpeople involved was less than 1 per cent. of the industrial population, and this percentage would be still further reduced if agricultural labourers and seamen were included, as few strikes and lock-outs occur among these people. Spread over the same industrial population, the amount of time lost through industrial disputes was only about one-quarter of a working day per head in the year."

THE DUBLIN CONTRACT CASE.

A REPORT of the action taken by Messrs. Pearson & Co., Ltd., against the Corporation of Dublin to recover 36,000*l.* cost of extra pumping, was given by us recently. The Lord Chief Baron decided in favour of the Corporation. Messrs. Pearson appealed, and after several days occupied by argument judgment was given on Tuesday.

Mr. Justice Wright said he considered that, having regard to the engineering evidence given at the trial for the plaintiffs, it could not seriously be suggested that there was no evidence to go to the jury of misrepresentation on the plans. Evidence was given that no borings were made to test the depth to which the wall went, and that the plans were deliberately designed to induce the contractors to tender at a low figure. He was of opinion that there was evidence fit to be submitted to the jury of a representation false in fact regarding the vital part of the contract, and that actual damage arose to the plaintiffs in consequence of that false representation, and he further held that there was evidence that the representation was recklessly made without any *bona-fide* belief in the existence of the wall. A more pressing difficulty arose regarding the question whether the representations on the plans were controlled by the provisions in the specifications. In his (Mr. Justice Wright's) opinion the provision in the specification only safeguarded inaccuracy in the measurement, and it was for the jury to say whether the plans prepared by the engineers were not intended to throw the contractors off their guard. He did not think that there was any real force in the views suggested by the defendants that they were not responsible for the acts of their engineers, and in his view the Public Authorities Act did not apply.

Mr. Justice Boyd concurred. He could not find one particle of evidence which justified the defendants in making any representation in the matter. To the depth of 9 feet the plaintiffs were assured of the existence of this outer harbour wall, but below that the defendants said they had no information. No borings or investigations were made to

justify the defendants in making this representation. Defendants had not a particle of evidence as to the nature or character of the North harbour wall; nor had they sought for or obtained any information on the subject, and yet they stated in clause 47 of their specification that the information given on the contract drawings was the best in the possession of the Corporation, but that they did not hold themselves in any way responsible for inaccuracy as to the wall—not for its non-existence.

Mr. Justice Gibson said the real matters of importance in the case were six in number. First, was there evidence of any representation as to the wall going down 9 feet below datum; second, was there evidence that such representation was intended to be acted on; third, were the plaintiffs at liberty to act upon such representation; fourth, was there evidence that, if the plans amounted to a representation, such plans were prepared without honest belief in the representation they contained, and in reckless disregard of the information they contained; fifth, was there evidence that the defendants had no real information as to the wall as described in the plans; and, sixth, was there evidence that the plaintiffs sustained loss by reason of the misrepresentations they made? Apart from the operation of the forty-third clause of the specification, the Lord Chief Baron was of opinion that the first three questions should be answered affirmatively, but that the clause, when considered in its relation to the contract, successfully repelled any intent of fraud. The plaintiffs contended that even if the engineer was not aware, as a matter of fact, that the wall foundation was non-existent, he was still without information that the foundation did, as a fact, exist, and that the foundation depicted was reckless guesswork. On the whole case he must therefore decide that the direction was erroneous, but in doing so he confined himself solely to the question whether there was a case to go to the jury.

The Lord Chief Justice, in dissenting from the opinions of the majority of the Court, said that no graver charge could have been brought against a public body than the charge that had been made in this case. He ventured to ask, when did it become known that the drawings incorrectly represented the physical conditions; when did it become known that the drawings were so entirely wrong? There was a letter from the plaintiffs, dated July 9, 1902, in which they stated that "there was no foundation whatever for the allegation that there has been any misrepresentation of facts in connection with this contract." When the actual state of things was discovered the Corporation, so far from insisting that the contract entered into should be performed, said in effect, "Do what you consider practicable in the situation, and we will pay you." So far from retiring from the undertaking were they that a new plan was devised by the plaintiffs and the defendants' engineer to carry out the scheme, not by the original method, but by a different plan. In his Lordship's opinion, what amounted to a new contract was entered into, and the obligation which was thus created was not, in his opinion, an obligation under the original contract, but under a new contract to do other and different work from that contemplated by the original contract. It was found in doing the work referable to the new contract that more pumping than had been contemplated by the new contract was necessary, and it was for the expense of that extra pumping that the action was brought. Then was made for the first time the belated discovery of fraud. He (the Lord Chief Justice) was clearly of opinion that there was no evidence of fraud which ought to be submitted to the jury. It was not pretended that the contractor discharged his duty under the 43rd clause in the contract, by which it was distinctly provided that the contractor should act for himself by himself alone; and it was not denied that he could not have fallen into any mistake whatsoever had he done so. If he went astray he did so by ignoring his own specially imposed obligation. What the Corporation said in effect was:—"Here are the plans and drawings prepared by our servants, check and verify them for yourselves. That is your special function." And because in blind confidence, in disregard to their special obligation, and to save trouble and expense, the plaintiffs acted upon representations which, as far as the Corporation or its servants were concerned, were never intended to be relied upon unchecked by the contractor, the plaintiffs in their extremity, there being admittedly no warranty or guarantee, turned round and imputed fraud to the defendants.

The verdict was accordingly set aside, with costs to the plaintiffs. Execution was stayed.

NEW CATALOGUES.

We have lately noticed a catalogue of their lifts by Messrs. R. Waygood & Co., Ltd. A new edition has been issued describing their electric and hydraulic, belt-driven and hand lifts, on the production of which they employ 1,000 men and expend over 65,000*l.* a year in wages. The description of some of the cranes made by the firm is interesting. Many examples are to be seen in Thames warehouses. The operations of one at Fishmongers' Hall wharf are daily watched with interest from London Bridge. Messrs. Waygood & Co. are now producing electric cranes with controlling gear which are economical, safe and readily worked.

This year's edition of the new catalogue of Messrs. G. & D. Musgrave, Ltd., is one which must gratify every lover of sanitation. The objects described suggest efficiency, and the appearance of all of them is satisfactory. The manufacturers say in their introduction:—"We are producing porcelain enamelled fireclay ware, the quality of which is vouched for by the fact that recently we have been entrusted with some of the largest contracts which have been placed. As regards design, we not only pride ourselves that ours are nowhere superseded, but that anything that can be made in fireclay we can make. The whole of our white goods are enamelled with an opaque white enamel, which, together with the fine surface we obtain on our goods, gives a finish equal to the best earthenware, at the same time having the benefit of the greater durability and strength of fireclay." This is not unwarranted boasting. It is rather an under-statement of the facts. In the catalogue there are some hundreds of illustrations of baths, urinals, closets, slop-hoppers, cisterns, wash-tubs, sinks, hospital fittings, lavatories, fittings in general and sundries. The whole of the contents is arranged in a perfectly business-like manner, and as for all costly productions there is a specification every architect can realise exactly what he will obtain when he gives an order. For instance, one of the "Diamond" urinals is thus described:—"Porcelain enamelled fireclay egg-shaped backs and sole-plates in one piece; divisional piers, ornamental sloping capping, fountain tank, treads with vitreous mosaic centres, copper automatic 'drop by drop' syphon, gun-metal flushing nozzles and all necessary connections." Here, as throughout the pages, verbosity is avoided. The tank referred to is not only of vase-like form, but it is further improved by becoming a fountain. In some of the closets care is taken to prevent the risk of contagion. There are several patented improvements shown. Prices are given throughout, and it will be found that all requirements for sanitary appliances, whether for private houses or hospitals, workhouses, schools, asylums, can be provided satisfactorily and promptly by Messrs. Musgrave.

BUILDING LINES IN FULHAM.

On May 3, 1904, the Building Act committee of the London County Council reported that a successful appeal had been made to the Tribunal of Appeal against the certificate of the architect of the Council, acting in the capacity of superintending architect of metropolitan buildings, defining the general line of buildings on the south side of Fulham Road, westward of Munster Road. On December 22, 1905, the superintending architect defined the general line of buildings on the western side of Fulham Park Road between Fulham Road and Landridge Road, but an appeal was made against his certificate, and on January 23, 1906, the Tribunal of Appeal reversed the certificate and decided that there was no general line of buildings on the western side of the street leading from Fulham Road to the junction of Fulham Park Gardens and Fulham Park Road. The result of this decision is that, except in so far as the provisions of section 13 of the London Building Act 1894, as to the prescribed distance may apply, there is nothing to prevent the erection of houses on the site in question close up to the public way. In order that the effect of these decisions of the Tribunal of Appeal, which enable the applicants to build very considerably in advance of the lines defined by the superintending architect, may be clearly understood, instructions have been given for a cartoon to be prepared and hung in the Council chamber. The building lines, as defined by the superintending architect of metropolitan buildings, are shown in red colour, while those defined either actually or in effect by the Tribunal of Appeal are shown in green colour.

WALL-PAPERS.

A SPECIAL exhibition of new wall-papers is announced to take place at Messrs. Jeffrey & Co.'s spacious gallery, 31 Mortimer Street, Regent Street, W., from March 5 to

March 16 next. This fine show-room is to be decorated, we are informed, with large screens, displaying a selection of the firm's finest productions, both of machine and hand-printed wall-papers of the latest designs, and with these there is to be exhibited a number of beautiful hangings that harmonise with the various papers, of which all classes are to be represented, including the choicest productions of the new season, from cheap machine-printed goods to the highest grade hand-printed, such as flocks, silk flocks, lacquers, damask effects and chintzes, besides tapestry effects on a new canvas texture, &c. On the walls will be hung some of the original designs by Walter Crane, Lewis F. Day, Heywood Sumner, A. F. Vigers and others. There will also, it is understood, be a number of the Crown decorations exhibited as well, consisting of papers in which the frieze and filling are made in lengths, so as to give greater effect of freedom. We give an illustration representative of some of the designs which will be shown on the occasion referred to.

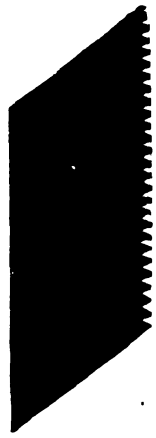
THE INSTITUTION OF CIVIL ENGINEERS.

AT the ordinary meeting on Tuesday, February 20, Sir Alexander Binnie, president, in the chair, the papers read were :—"A Plea for Better Country Roads," by G. R. Jebb, M.Inst.C.E. ; and "Country Roads for Modern Traffic," by J. E. Blackwall, B.A., Assoc.M.Inst.C.E. The following are abstracts of these papers :—

The author of the first paper, after pointing out that the proper maintenance of the country highways is a matter in which the whole community is interested, that the traffic on them is probably greater now than it ever has been, that many of them are badly maintained at extravagant cost, and that a new kind of traffic, viz. the motor-car traffic, has sprung up during the past few years, urges that the present is a specially fitting time for engineers to consider—

(1) Whether they are adopting the best methods of maintaining the roads. (2) What improvements are

"MAXIMUM LIGHT GLASS."



LENSES AND PRISMS COMBINED IN ONE SHEET.

ABSOLUTELY THE BEST FOR DAY-LIGHTING DARK INTERIORS.

Increases the Daylight from 5 to 20 times.

By reason of a lens surface running vertically on the outside and at right angles to an interior prismatic surface, this glass possesses a double refractory power.

All the light from the sky is gathered, projected, and completely diffused.

The use of the "Maximum Light Glass" lessens the cost of artificial lighting.

Supplied in ordinary window-glass sizes.

Also in ornamental designs in lead or copper.

necessary to fit the roads for the new and increasing traffic. With regard to (1) the author specially advocates that the roads should be better drained, and kept dry and free from mud; and he enumerates some of the advantages which the public would enjoy if this were done. Among these advantages is the fact that the dust nuisance, which has become a very serious question, would be practically abolished. He considers that the extra cost of labour would be more than counterbalanced by less outlay on future repairs.

With regard to (2) the author considers it impossible to lay down any general rules that would be applicable to all roads in all districts; he recommends that the roads should be classified, and that they should be strengthened and improved on scientific principles according to special circumstances. More care should be taken in the selection of stone for macadan, and he deprecates using local stone because it is the cheapest. He invites discussion, and hopes engineers to county councils and others will state the result of their experience in the maintenance of roads, and especially as to the use of "Tarmac" or other dust-preventing material. He thinks that money would be better expended in improving the existing roads than in making new ones.

The author also strongly recommends that all country roads should be repairable by the county councils, and points out generally, and also by reference to a special case, some of the serious disadvantages of the present system, under which the main roads only are repairable by the county councils, all other roads being repairable by district and borough councils.

If the author's suggestion as to keeping the roads free from mud were adopted throughout the country a large number of additional labourers would be permanently needed, and he believes their work would be remunerative. If the roads were generally improved a further large number of men would be wanted for several years to come, and the author thinks that no better or more useful work could be found for some of the able-bodied men who now swell the ranks of the unemployed, and that the work would be free from the serious objections which have been raised to many of the schemes which have been suggested for the benefit of that class.

The author of the second paper points out that it is now universally acknowledged that a radical improvement is required in the main roads of England, so that heavy traffic, consisting of traction-engines, motor-lorries and heavy carts, shall not cut up the surface and render it inconvenient for light, fast traffic, including motor-cars, light carriages and cycles, and that foot passengers shall be protected from being run down or choked with dust by motor-cars. He suggests the gradual alteration, as funds allow, of existing main roads into twin roads, one for heavy traffic and the other for light, separated by a fence and a footpath. From what little data at present exists on the subject of the cost of maintenance of roads required for heavy traffic only, or for light traffic only, it appears probable that a saving of expense would in the long run result, and there would be beyond doubt advantages to the users of the road by separating the traffic. Whether the advantages would be worth the initial cost of alteration is a matter of opinion.

The details of construction would vary considerably according to local circumstances, the amount and weight of traffic, the value and nature of adjoining land, the cost of material delivered, &c. The minimum width of the two roads and footpath together should be at least 46 feet between fences, 21 feet for each road and 4 feet for the footpath. The surface water would be conducted into a pipe drain under the footpath by pipes laid near the surface under the light road, and by cross gutters over the heavy road, both roads sloping down towards the outer sides and towards the footpath. The two roads would converge into one at the entrance of a village or any confined space. All crossings of roads would be notified by sign-posts, and speed of traffic reduced to a safe maximum. At gateways into fields on the side of the light road a space would be left in the wire fence, closed by a rail pivoted to a post near one end, and opening upwards, assisted by a counterpoise at the other end.

For purposes of considering the probable cost of conversion of a road into a twin road the items which would occur on a typical road are set out below with suggested prices. It is assumed that the road, originally 30 feet wide, is widened to 46 feet between fences, and that the extra land required for this widening is given by the adjoining owner for the good of the public.

THE RITZ HOTEL.

THE Ritz hotel in London is a large steel frame, fireproof, six-storey building, which has recently been constructed by a firm closely allied to a leading American contracting company, and in which, says the *Engineering Record* of New York, considerable American plant has been used. Its site, about 80 feet by 150 feet, was previously occupied by two seven-storey brick hotels with cast-iron H-shaped columns which supported the upper walls and the steel beam and concrete floors. The side wall footings were unsymmetrical, with extensions on the inside only. All footings were built on a solid continuous mass of concrete 3 feet thick which covered the entire area of the site.

The buildings were demolished by a "house-breaking contractor," who first removed valuable materials in the roof and elsewhere and erected shields outside the building to prevent bricks and rubbish from falling into the streets. The walls were broken up with picks and crowbars, and the bricks put in baskets and lowered by a rope and single block, either outside the building to an area, or inside through well holes cut in the floors. At the first floor this material was at first carried by hand to carts in the street. After part of the building had been torn down the ground floor was used for storage of the *débris* from the remainder of the building, and the carts were loaded there instead of in the street. After the superstructure was thus removed an inclined wooden platform was built from the first floor to the basement, and carts were driven over it to remove the remainder of the old materials.

In order to remove the 3-feet layer of cellar floor concrete 2½-inch holes 22 inches deep and 18 inches apart were made in it by two American Consolidated Pneumatic Tool Company drills, each of which was operated by one man and drilled about fifty holes per day. The concrete was blasted out, broken when necessary by a sledge and chisels and loaded by hand into carts. Below the concrete the general excavation was continued about 4 feet to a depth of 22 feet below the curb, using pick and shovel through hard, dry blue clay. The spoil was loaded by hand like the concrete into carts. Open unsheeted pits were dug about 4½ feet deeper for the column foundations.

The party wall of the adjacent building was about 40 feet high and was so thick and strong that it was underpinned without the use of needle beams. Pits about 6 feet deep, 6 feet long and 6 feet apart in the clear were excavated under the old footing without destroying the stability of the unsupported wall above them or causing any injury to the masonry. In them new footings were built at the level of the footings for the new building, and on them brick piers were built up to engage the old wall. When they were well set the weight of the old wall was transferred to them, the spaces between the first set of pits were excavated, and the footings and brick underpinning made continuous between the underpinning piers, thus extending the old wall down to the required depth. During these operations no bracing was used except inclined shores.

Before removing the old walls below the first floor a trench, sheeted and braced in the usual way, was excavated all around the sides of the building, and in it was built a brick retaining wall 5½ feet thick at the base and 2 feet thick at the top, heavy enough to resist the outside pressure without bracing. This wall was waterproofed by a damp-course ¾-inch thick of asphalte applied in two layers on the inner surface of a 4-inch brick outside wall built up in 18-inch courses in advance of the main wall.

The new walls have offset brick foundations and concrete footings. The column foundations are two tiers of I-beam grillages on a concrete footing 18 inches thick, carried down to a level 5½ feet below the basement floor. The spaces between the grillage beams, and for at least 4 inches all around them, were filled solid with concrete, and the cast-iron column pedestals were set on a ½-inch filling of grout with their planed tops 6 inches below the basement floor.

The 1:3:5 concrete was made with Anderson and J. B. White brands of Portland cement and with stone

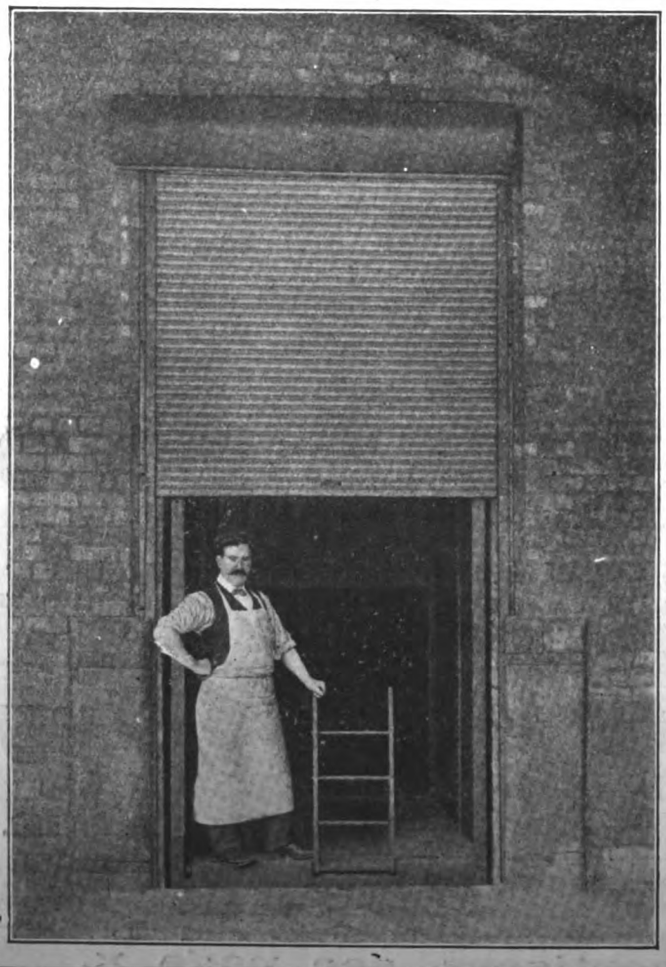
small enough to pass through a 2-inch ring. The mixed sand and stone from the Thames river was dumped on a platform, cement mixed with it, and the mass turned twice by hand. Water was added from a sprinkling can, it was turned again, shovelled down about 4 feet into the foundation trench, stamped slightly and smoothed on top.

No materials were stored at the site, all were delivered by carts about as needed; the steel was hoisted by derricks and either erected without releasing it from the slings or was temporarily deposited on the floor next below its destination. Other materials were generally taken in wheelbarrows to the three elevators located in different parts of the building. Mortar was mixed by two machines in the basement, stone was dressed on the platform built over the sidewalk around two sides of the building and just above a watertight roof protecting pedestrians from drip and falling objects.

Steel was delivered in 2-ton lots and was unloaded, hoisted and erected by one 5-ton steam guyed derrick with a 65-feet mast and 55-feet boom, and by two 5-ton steam stiff-leg derricks or "Scotchmen" with 75-feet booms swinging through an arc of 270 degrees. These derricks lifted loads up to 6½ tons; the guyed derrick was like those used in New York and was operated by a Lidgerwood double-drum friction hoist. It was raised two storeys at once in four hours. The Scotchmen were raised only twice, and each operation took two days, the work being done on Saturday and Sunday so that only Saturday morning was lost for working time.



The heaviest members were handled by special methods; they consisted of three 20-ton 39-feet plate girders carrying exterior walls and columns in the second storey. There are also eleven 11-ton cantilever girders in the basement to carry the walls adjacent to the neighbouring buildings. The steelwork was assembled without much reaming; in the few cases where reaming was required it was done by a pneumatic drill. The best record for field rivetting was 190 rivets driven in one day by two men and a heater, using a pneumatic hammer; three men and a heater drove about 160 rivets a day by hand. No temporary wind bracing was required for the steel framework, but the columns were plumbed by guys run from the top of one column to the foot of another column and adjusted by turnbuckles.

Steam for the five derricks and the concrete crusher was made in six independent boilers, one for each. Steam at 80 to 100 lbs. for the air-compressor was provided by another boiler. A 200-volt electric current for lighting, and a 400-volt current for the motors in the basement which operated the elevators, was procured from the Westminster Electric Supply Corporation.

The principal quantities involved in the building include about 8,000 cubic yards of clay and 330 yards of concrete excavated, and about 2,700 tons of structural steel erected. An average force of about 300 men was employed throughout the work. The removal of the old buildings was commenced in 1903. Excavation was commenced in June 1904. Foundations were built in July. The erection of the steelwork was commenced early in September and finished the last of December 1904. The greatest weight of steelwork erected in one week was 130 tons. The walls were commenced in December 1904 and finished the last of May 1905. Interior construction was commenced in May 1905, and the building was enclosed October 1, 1905.

Besides the items already mentioned the principal plant included one 3-ton hand derrick with a 35-feet jib, two 3-ton American boom derricks, one 2½-ton American house derrick, twelve 1-ton American house derricks, four hand crabs, two Harman cable drums for hoisting, four 15 h.p. motors by the General Electric Co., London; one horizontal straight line air compressor, with a capacity of 117 cubic feet of free air per minute at 160 revolutions; two 6 ft. 4 in. by 33 in. air receivers, two pneumatic drills, six pneumatic rivetting hammers.

The architects were Messrs. Mewes & Davis, of London; Mr. J. P. Bishop was the architect for the executional work; Mr. J. W. F. Bennett was the superintendent of erection; Mr. E. Wingfield Bowles, of London, was consulting engineer for heating and ventilation. The steel was designed by Mr. S. Bylander, fabricated by the Burbacher Huette, of Germany, and erected by the Waring-White Building Co., Ltd., as the general contractors for the building. The Columbian Fireproofing Co., London, was the contractor for floor construction; the National Fireproofing Co., New York, for partition tile; Yale & Towne, Ltd., New York and London, for hardware; and the Otis Elevator Co., London, for elevators.

Architects, Contractors, and others are recommended to journey by the

GREAT CENTRAL RAILWAY.

They will find it

RAPID TRAVEL IN LUXURY.

Each Express is VESTIBULED and has a BUFFET CAR attached available for FIRST and THIRD-CLASS PASSENGERS.

The London Express Trains centre on Sheffield, branching therefrom westward to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool; northward to Huddersfield, Halifax, Bradford, Leeds and York; eastward to Doncaster, Grimsby, Hull and North Lincolnshire.

Cross Country Expresses and Through Arrangements with other Companies are a distinct feature of the Great Central services. Liverpool, Manchester, and Sheffield are linked up by corridor trains with Lincoln, Harwich, Lowestoft, Norwich, and the Great Eastern system.

Newcastle, Sunderland, Durham, York, Bradford, Huddersfield, Rotherham and Sheffield are provided with through trains *via* Nottingham, Leicester, Banbury and Oxford, to and from Southampton, Bournemouth and the South-Western Line.

Bath, Bristol, Exeter, Torquay, Kingswear, Plymouth, and the Cornish Riviera are reached by Express Trains from Leeds, Wakefield, Halifax, Huddersfield, Sheffield, Nottingham, and Leicester.

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. off ordinary fares.

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BABS. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM. By HENRY BEYEART, Architect. This work contains the most interesting productions of Henry Beyeart, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work consists of 240 folio plates, in two portfolios. Price complete, £14 8s.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy Work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

RIO DE JANEIRO.—May 31.—Plans for the construction of National Congress building. Three prizes of 15,000, 10,000 and 5,000 milreis will be awarded to the three best designs. Particulars can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

WIGTON.—March 12.—For the relaying of passage floors at the union hospital with either concrete, tiles or wood blocks, for the Guardians. The Master of the Workhouse.

WORKSOP.—March 12.—For the erection of a bridge over the canal in Kilton Road. Mr. George Rawson, surveyor.

THE rebuilding of Baltimore after the fire two years ago has been remarkable. The area covered by the burned buildings was 2,380,000 square feet, of which 335,000 square feet were taken for street widenings by the Burnt District Commission, leaving 2,045,000 square feet available for building operations. The amount now rebuilt is 1,477,000 square feet, or 72 per cent. The total floor space in the district was 8,534,000 square feet, exclusive of the part appropriated for public purposes, whereas it is now 6,613,000 square feet, or 79 per cent. of the former amount. The value of the new buildings is estimated at about 20,000,000 dols., and over half of them are now ready for use.

THE by-laws affecting painters' work in Aberdeen for the ensuing year have now been adjusted between the employers and the men. The rules for last year are to remain in force till the end of February next, the men objecting to alter the date to December 31. The Masters' Association desired the addition of a clause binding the men to withdraw their members from the service of non-associated employers, which would be a counter-balance to the rule under which the operatives' union have power to withdraw their members from the service of a master who employs non-union men. The men, however, resisted the introduction of such a rule, but an undertaking was arrived at by which union men, as far as possible, would not work for non-associated employers.

TRADE NOTES.

The slates for the Ritz Hotel were supplied by the Buttermere Green Slate Co., Ltd., Keswick, of which Mr. B. Johns is secretary and manager. Where so many American products were employed, it is satisfactory to find that for such important work as the slating the Buttermere Green Slate Company's quarries were drawn on.

Messrs. W. Macfarlane & Co. have supplied the verandahs which extend along each floor of the Leander Residential Buildings in Johannesburg, and which impart to it a novel character.

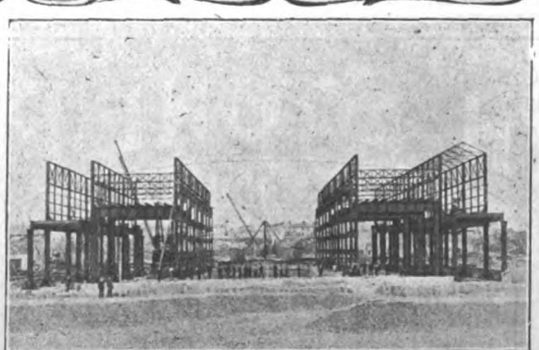
A large chiming clock with four dials is now being erected on the parish church, Whitefield, near Manchester, by Messrs. John Smith & Son, Midland Clock Works, Derby. It is the gift of Colonel Mellor, of the Woodlands, Whitefield.

The St. Pancras Ironwork Co., Ltd.—It is announced that Mr. Arthur Pye Smith has been elected chairman of the Board, and Messrs. Hugh Leader and T. Percival Chubb have been elected directors of the Company

Thomas Piggott & Co., makers of pipes, tanks, and steel structures, &c., have recently obtained orders for the following:—Rivetted steel pipes, 63 inches and 78 inches diameter, for export; 12 rivetted steel leaching vats, 50 feet by 25 feet, for West Africa; cast-iron steam-pipes for Birmingham electric power station.

Messrs. W. B. Simpson & Sons, 97 and 99 St. Martin's Lane, W.C., have supplied their patent grip stoneware tiles for the Baker Street and Waterloo Railway. The scheme of colour is a novel one, each station having a different colour scheme, *e.g.* Baker Street station is treated in two blues, and Waterloo brown and green, and the flying coloured bands which divide the stations into a series of arched bays form an effective feature in this scheme. The tiling to corridors and circular staircases are treated in the same colour scheme as the platforms, the tiles to the staircases being fixed with vertical joints so as to work round the walls, which are of necessity circular on plan. The names of the stations are written in bold letters on the tiles, being permanently fired on. On the Great Northern, Piccadilly and Brompton and the Charing Cross, Euston and Hampstead Railways, which contracts they also have, all the indicating lettering, as "To the trains," "Way out," &c., are all being executed on the tiling, which greatly facilitates cleaning operations, the alternative being to fix enamelled iron tablets on the face of the walls. The booking hall tile colour treatment is in green and cream, and the glazed faïence booking hatches form a feature, as also the permanent lettering.

ELECTRIC NOTES.



The electric-light committee of the Coventry Corporation recommend the Council to apply for the Local Government Board's sanction to a loan of 35,000*l.* for extensions at the electric-light works.

The electricity committee of the Islington Borough Council proposes to seek a loan of 17,200*l.* from the London County Council for the purpose of extending the electric arc lamp system of street lighting. This it is estimated will prove more economical than gas.

Negotiations are at present in progress between a group of London financiers and electric engineering experts and the Glasgow Subway Company for a transference of this undertaking to the former body, with a view, it is believed, to its electrification.

A movement is on foot to promote an electric lighting syndicate which will, with the assistance of the Blackrock Urban Council and under the authority of the Board of Trade, control electric lighting systems in Dalkey and Kingstown, as well as two new tramway routes from Blackrock, co. Dublin.

The chairman of the electricity committee of the Leeds Corporation has stated that the electrical undertaking is not at the present time on a sound basis financially. He states that the sums, amounting to 16,000*l.*, taken from the undertaking for the relief of rates were not properly so applicable, but that if that amount with interest is refunded and no further sums be withdrawn the undertaking will probably be able to meet all claims upon it. He recommends that sanction should be at once sought to borrow 120,000*l.*

VARIETIES.

THE second International Congress on school hygiene will be held in London from August 5 to August 10, 1907, under the presidency of Sir Lauder Brunton.

THE Council of the Iron and Steel Institute have awarded the Bessemer medal for 1906 to M. Floris Osmond, the French metallurgical physicist.

THE King's Norton and Northfield District Council have decided to take steps to provide central public offices. Five sites are under consideration.

THE United States Congress are to consider the plans for coast defence, which will cost 50,879,399 dollars to carry out.

THE Alfreton Urban Council have adopted a scheme prepared by Mr. Radford for the relining of the Lindway reservoir and laying of new water mains at a cost of over 13,000*l.*

THE Stockton Town Council, in view of the strong opposition which has been raised to a proposal to purchase for 11,000*l.* an estate at the north end of the town for conversion into a public park, have decided not to proceed with the scheme.

MR. RADFORD, consulting engineer, in a report on a scheme of sewage disposal for Thorpe, recommends the Chertsey District Council to construct additional bacteria beds and drain the subsoil of the land at a cost of 4,900*l.*

MESSRS. J. & P. COATS, LTD., are about to erect a new thread mill at Paisley. Various plans are being considered, but the building is likely to be 400 feet long, 100 feet in breadth and three storeys high.

THE Chester Town Council have approved a scheme for the provision of twenty-seven working-class dwellings at weekly rentals of 2*s.* 6*d.*, 2*s.* 9*d.* and 3*s.*, which will entail an annual loss of 144*l.* 6*s.*

MR. THOMAS CRABTREE, of Rochdale, builder, who died on December 13 last, left estate of the gross value of 15,653*l.* 4*s.* 5*d.*, of which the net personalty has been sworn at 15,442*l.* 5*s.* 6*d.*

THE North British Railway Company will promote a Bill for the construction of a new dock at Methil which will accommodate steamers of from 5,000 to 7,000 tons. The cost, it is believed, will run to about 500,000*l.*

THE Governors of the Peabody donation fund are erecting 154 cottages of five rooms each at the Tottenham estate, and it is expected that some will be completed towards the close of the present year.

PLANS have been adopted for the widening of Firgrove bridge which spans the Rochdale canal. The bridge will be widened from 13 feet 4 inches to 42 feet, and there will be an increased waterway of 1½ yard. The total cost of the bridge will be 3,000*l.*

THE Preston Operative Cotton Spinners' Association have decided to erect a statue to perpetuate the memory of the late Mr. James Mawdsley, who has been general secretary of the Amalgamated Association of Cotton Spinners for twenty-four years.

THE West Ham Board of Guardians have decided to appeal against the decision of the Divisional Court awarding 100*l.* damages to a pauper inmate of the workhouse who sustained injuries by falling from a scaffold on which he was working at the West Ham infirmary.

THE building plans committee of the Blackpool Corporation has had submitted to it plans for the erection of fifty-two canvas tents, containing beds for visitors, close to the sea. The Blackpool Company Housekeepers' Association is opposing the scheme.

THE Rugby magistrates on Tuesday considered plans submitted on behalf of the Rugby Theatre Company for a theatre on the site of the town hall, for the purchase of which the company is in negotiation. The building will cost from 20,000*l.* to 30,000*l.* The decision will be given next week.

A SUB-COMMITTEE of the Edinburgh Town Council received a deputation representing the Edinburgh Master Butchers' Association with regard to the new markets and slaughter-houses. The sketch plans were gone over with the view of obtaining as far as possible the views of the meat trade before the plans are finally adopted.

THE Builders Clerks' Benevolent Institution state in their annual report that the receipts from all sources during the year were 1,184*l.* Of that sum 623*l.* had been disbursed in pensions and 42*l.* granted in temporary relief during the twelvemonth. Consols to the amount of 500*l.* had been added to the holdings of the Institution. On October 31 last four widows and one aged clerk were added to the list of pensioners.

THE annual report of the road surveyor to the Perthshire Highland District committee stated that the experiment of binding metal with tar chips instead of soil had been quite successful. The surface of the road in summer was smooth and elastic, and free of dust and mud, while winter labour had been reduced to a minimum. The cost of putting down the metal with tarred chips was not greater than by the ordinary method. The use of this method is to be extended.

THE public health committee of the St. Pancras Borough Council have approved the borough treasurer's estimate for the erection of working-class dwellings on the Brantome Place area. The land is estimated to cost 7,000*l.* and the buildings, &c., 22,200*l.*, and, while the annual income is estimated at 1,865*l.*, the annual expenditure is set down as 1,856*l.* The weekly rental is fixed at 3*s.* 4*d.* and 3*s.* 6*d.* per room.

THE Barrow Town Council on Monday considered the proposal to pay the Furness Railway Company 30,000*l.* compensation for the Walney steam ferry, owing to the Corporation building a bridge across Walney Channel. It was pointed out that the offer was really the outcome of an interview with the Duke of Devonshire, and if they went to arbitration, and had legal expenses to pay, the amount would be greater still. It was decided by a large majority to pay the money.

AT a special meeting of the Middlesbrough Corporation on the 6th inst. the recent inquiry by the Light Railway Commissioners respecting the application by a company for an order to construct a tramway between Middlesbrough and Hartlepool, with a transporter bridge across the river Tees, was discussed, and it was decided that the Corporation should strenuously oppose the scheme of the promoters as far as the transporter bridge is concerned, and that in the event of the opposition being successful the Corporation should apply for power to construct a transporter bridge or adopt some other rapid and efficient means of crossing the river.

THE Secretary to the Admiralty was asked in the House of Commons on Monday whether contractors for harbour works were required to use British granite only, whether British granite only was to be used on the Keyham Harbour works, and whether he would give instructions that all contracts over which the Admiralty had control should stipulate that only British granite should be used. The answer given to each of the three parts of the question was in the negative, with the qualification that the Admiralty cannot fetter their future action.

A CONFERENCE convened on the 1st inst. by the Plrmbers' Company at the Guildhall adopted the following resolution :—"That in the opinion of this conference of representatives of municipal, educational and labour interests the time has now arrived when a more systematic training than has hitherto prevailed among the industrial workers of this country is imperatively required, in order that our skilled trades may maintain and increase their efficiency, and so hold and improve their position in face of the prevailing conditions of modern commercial and industrial competition." A committee was appointed to consider the whole subject.

MR. JAMES DIGGLE, who has been called in to advise the Burnley Corporation with respect to increasing the town's water supply, has presented a report in which he points out that Burnley's population is 100,000, and with a daily consumption of 25 gallons per head the total demand is for 2,500,000 gallons. The present available supply, however,

is 2,006,000 gallons. The total capacity of the existing reservoirs is 440,000,000 gallons. After reporting on various sites which he has examined, Mr. Diggle advises the making of a reservoir in the Thursden Valley, with an 88 feet embankment, to hold 400,000,000 gallons.

THE Epsom Urban District Council recently received tenders for concrete tubes for dealing with the disposal of sewage from the Long Grove asylum. The lowest tender was from a foreign firm. The next, from Messrs. John Ellis & Sons, Ltd., of Leicester, worked out at about 100*l.* higher in the cost of the whole of the tubes. The feeling of the committee was that the tender of the English firm should be accepted, and they had communicated with the London County Council, who are responsible for part of the cost, asking their opinion. The London County Council replied in favour of the English firm's tender. The tender, therefore, of Messrs. Ellis & Sons for 3 feet 4 inches by 5 feet tubes at 2*l.* 15*s.* a yard and 2 feet 6 inches by 3 feet 9 inches tubes at 1*l.* 16*s.* 9*d.* a yard has been accepted.

MR. J. E. TUIT, a director of Sir William Arrol & Co., has died at the age of forty-six. Educated at King's College, London, and trained as an engineer in the bridge department of the Great Western Railway, he became an assistant to Sir John Fowler and Sir Benjamin Baker in 1882, and was occupied on the design of the Forth Bridge. In 1884 he was appointed to Sir William Arrol's staff, and was responsible for the design of the staging and other temporary works which enabled the workmen to carry out their operations on the projecting members of the giant cantilevers. Mr. Tuit, on the completion of the Forth Bridge, came to London, and was in sole charge of the erection of the Tower Bridge for Sir William Arrol & Co. His most prominent recent work was the designing of the bridge two miles in length across the Nile at Cairo.

MESSRS. LEMON & BLIZARD, engineers, in reporting to the Wilton Rural District Council on the progress of the Bemerton drainage scheme, said they had now finished everything in Wilton Park, and they wished the Council to know of the very great assistance given them by Lord Pembroke and Mr. Kendle. The work was very difficult and troublesome. They cut about the roads, and in some cases had small trees removed. All this was allowed without complaint. It was not often, they said, engineers and contractors got such consideration shown to them as that which they had received, and it had been the means of saving a very considerable amount of time and money. The letter added that Lord Pembroke was a frequent visitor to the work, and he appeared to take a deep interest in its progress.

THE West Ham Guardians have considered a report from the consulting engineer with reference to the boiler foundations at the Whipp's Cross infirmary, which was erected and fitted three years ago at a cost of about 250,000*l.* The engineer reported that he found the boilers had gone down considerably from the level at which they were originally erected. The walls parallel to the boilers both leaned inwards and the floor of the engine-room sloped downwards towards the boilers. The curve line of the fracture, clearly visible on the floor, showed that the weight of the boilers was dragging everything about them downwards. Careful plumbing showed that all the walls, even at some distance from the boilers, were affected. All efforts at underpinning the boilers were of no avail. In accordance with the engineer's suggestion, the boilers will be suspended from girders by steel straps capable of standing a strain of from 30 to 35 tons per square inch.

LORD CLAUD HAMILTON, when presiding at the annual meeting of the Employers' Liability Assurance Corporation, Ltd., referred to the intention of the Government to introduce a Bill for the amendment of the Workmen's Compensation Act. When the existing Act came into force the directors found in the course of a few years that the business in relation to it could only be worked at a very small profit—if at any profit at all—owing to the decrease in rates due to competition. As a result the board decided to discontinue that business except at such rates as would be likely to prove fairly remunerative. This class of business, from the time when the company first took it up, had been worked at a slight profit; but, in spite of the high rates, the business during the last two years had been actually done at a loss. In 1901 for every settled case arising from death the company paid 113*l.* and for every case of permanent disablement 55*l.*; for 1902 the figures were respectively 121*l.* and 60*l.*; for 1903, 112*l.* and 67*l.*; for 1904, 114*l.* and 75*l.*, and for 1905, 117*l.* and 87*l.* respectively.

THE Chicago subway is now practically completed, and will be in full operation within a few weeks. In fact, it is claimed that by next summer the tunnel will be handling 30,000 tons of freight daily, the estimated net earnings being put at 5,000,000 dols. per year. The tunnel system covers the streets in the principal wholesale districts of Chicago, connecting the large business houses there with all the railroads entering Chicago. The plant comprises 179,797 feet of street tunnel, 13,483 feet of river tunnel and 14,932 feet of building connections and intersections, an aggregate of 208,212 feet. The equipment includes 100 locomotives and 300 steel cars having an average capacity of 3½ tons. The cars are built to fit the buildings where they enter, and can be taken up by elevators to any storey for loading and unloading.

OWING to the marked rise in the price of timber Dundee Harbour Board are reconsidering its position in connection with the construction of the proposed fitting-out jetty at Caledon shipyard. At a meeting of the works committee on Monday it was stated that owing to the enhanced value of the commodity in question the estimate of the engineer, originally stated at 1,750*l.*, would require to be increased by some 400*l.* In view of this fact, the committee was of opinion that it would be well to further consider the whole scheme, for the purpose of determining whether the main jetty might not be built of "Ferro" concrete, having the connecting slips and dolphins of timber. The employment of "Ferro" concrete to the extent indicated represents an increase in the original estimate of between 500*l.* and 600*l.*

NOTICE has been issued to the dockyards that, with the object of encouraging talent among the employés, a committee composed of dockyard officers has been appointed by the Admiralty for the purpose of considering original proposals which may be put forward by workmen, and of recommending to the superintendent monetary awards in those cases where the proposals are considered worthy of adoption or of sufficient merit to receive special recognition. Amongst the services for which such awards may be made are suggestions tending to greater economy or increased production, new designs of tools or improvements in existing tools, new designs of machines or improvements in existing machines, alterations in methods of manufacture or rearrangement of existing methods of manufacture, saving of waste material, means of utilising cheaper forms of material and prevention of accidents.

NEW CATALOGUES.

IF smoke and an impure atmosphere are considered as the bane of English architecture in cities and towns, it can be said that an antidote is now available by the Farnham Patent processes. One is an application of refined paraffin wax, which the stone is made to absorb to a depth of one-eighth to one-half of an inch according to its density. The material enters the pores of the stone and does not affect its colour. There is no chemical action of a deteriorating kind, but the stone is preserved from those effects of the atmosphere with which we are unhappily too familiar. In the Government Printing Office at Washington no less than 7,000 lbs. of paraffin wax were applied, and the quantity suggests the belief in the advantages of the process. The cleansing process will appeal more strongly to some people. It is the employment under a patent of the sand blast. We have had in England applications of fluids to buildings, and it has been generally acknowledged that their appearance was less satisfactory afterwards than before. The effects were not uniform even with a small façade. Sometimes there were streaks and sometimes blotches, for which a coating of soot was welcomed as a veil. With the sand blast there is not only no "messing," but as the stone is treated systematically there becomes uniformity of colour corresponding with the original appearance. The Farnham process has been applied to the Hôtel Cecil, both in the courtyard and in the Strand, to Maple's premises, Messrs. Pears's premises, and to a building which offered a very trying test, the Westminster Chapel, Buckingham Gate. Still later works are the Empress Club, the offices of the Phœnix Assurance Company, Charing Cross, Lloyd's quadrangle, Messrs. Hyam's and J. J. Coleman's premises in Cannon Street, Messrs. Cook, Son & Co.'s in St. Paul's Churchyard, and Block III. of the Admiralty. A good many of the revolutionary projects for transforming cities and towns arise from the doleful appearance of the majority of buildings. Indeed, some people have been compelled to wish for a return of stucco and

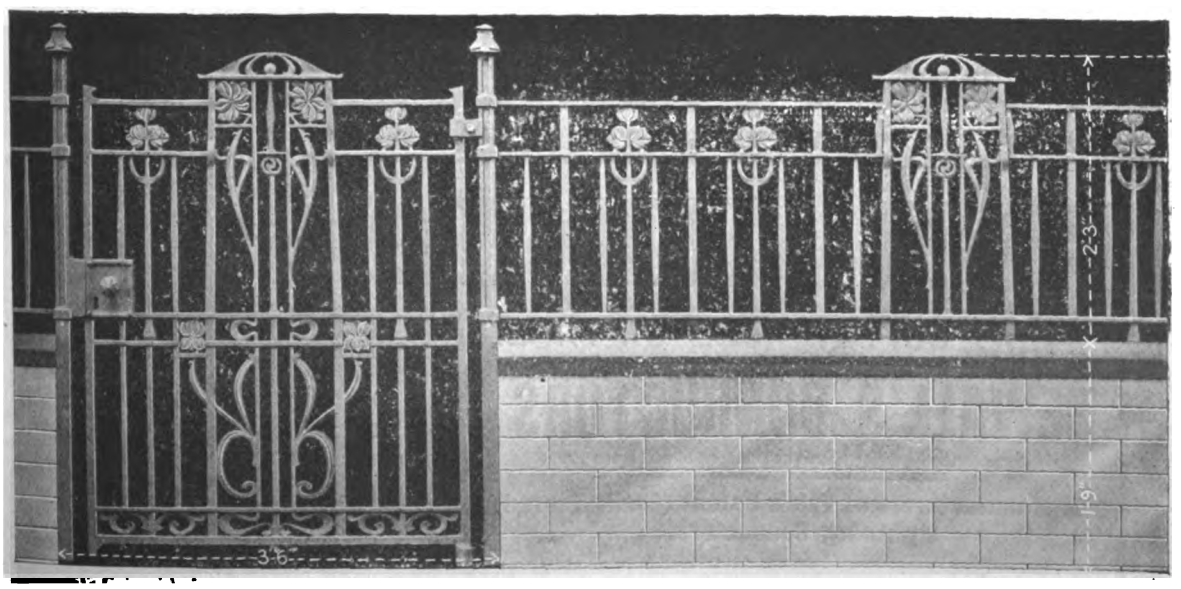
periodical painting. If the Farnham processes were more generally applied buildings would assume a more cheerful character, and greater justice would be done to their architectural detail.

THE firm of Lumby, Son & Wood, Ltd., have been so long established as manufacturers of wrought-iron and steel welded and rivetted boilers for heating apparatus, anyone who takes up their catalogue must be aware of the variety of their specialties. Indeed, the pages are sufficient to demonstrate the possibilities of radiators and all kinds of boilers for steam and hot-water heating. After nearly fifty years of experience they have mastered the most efficient ways of meeting requirements, and through the arrangements they have made in their new works they are able to guarantee their boilers for a period of two years against defective material or workmanship, and will replace any part free of cost. It may be said of the boilers that their variety is astonishing. But the firm do not confine themselves to radiators, boilers and fittings. They also manufacture fire and burglar-resisting steel safes, steel doors, strong-rooms, which have special properties. One advantage of the lists is that each object has a code word, and orders can therefore be telegraphed without much trouble or cost.

MR. J. N. MASKELYNE'S mysterious powers have long been the delight of thousands. But he is no magician in the ancient sense of the word, for all his magic by which he daily and nightly puzzles the public is simply owing to mechanical skill and inventive capacity. It is needless to say his patent coin-receiving locks, New Century lock and patent indicating door latch are among the inventions which prove him to be a true mechanical engineer, and indeed some of the technical institutions should endeavour to secure his services as professor. He is now bringing out a new registering lock, which will be no less successful than the other locks which have been employed by the principal corporations in the country, as well as by hotels, clubs, &c. The sole licensees and manufacturers are Messrs. Benham & Froud, Ltd., who have issued a catalogue which is well deserving of attention for the uses for which such locks are intended.

THE ADMIRALTY AND CONTRACTORS.

THE report of the Comptroller and Auditor-general upon the account prepared under the provisions of the Naval Works Acts contains the following observations on compensation paid without Treasury approval and without legal advice. Included in the charge against "Chatham Dock" is a sum of 13,000*l.* compensation paid to the contractors for the execution of this work under an award of the director of works, acting as arbitrator under Clause 8 of the contract. Owing to an irruption of water, or "blow" from the adjoining basin, into the excavations made for the new dock, the contractors were hindered and put to extra expense in carrying out their contract.



In making his award the director of works does not seem to have sought legal advice, although the Admiralty surveyors had expressed the opinion that the contractors were not legally entitled to any compensation, basing their opinion mainly on Clauses 5 and 8 of the specification "particularly with reference to 'any old work' in Clause 5, which appears to have specially contemplated the possibility of such a contingency as this 'blow.'" This opinion of the Admiralty surveyors was concurred in by the admiral superintendent of Chatham dockyard.

It would appear, therefore, that however equitable it may have been to make some allowance for the loss and hindrance suffered by the contractors, the award of compensation must be looked upon as an act of grace requiring Treasury approval. I bring the matter to notice because it would seem to be a departure from the ordinary lines of financial control that the director of works, acting as arbitrator under a contract, should be empowered to award compensation at his discretion, in such circumstances, without reference to the Treasury.

Clause 8 of contract is as follows:—If any doubts, disputes, or difference of opinion shall arise between the Admiralty or the superintending civil engineer and the contractor in reference to the execution of this contract or any part thereof, or as to the meaning of the same or any part thereof, or as to the meaning of the conditions, drawings, specification, or anything annexed thereto, or as to any matter arising out of the contract, specifications, drawings, conditions, or anything relating or incident

thereto, then such doubts, disputes, or differences shall be referred to the director of works, who shall have all the powers conferred on an arbitrator by the Arbitration Act, 1889, and who shall be competent to enter upon the reference without any further or more formal submission than is contained in this contract, and with such notice to the parties as he shall think fit. And the award of the director of works shall be final and binding on the contractor and the Admiralty respectively. The director of works may, if he shall think fit, appoint a legal assessor to advise him during the arbitration, and the fees of such legal assessor shall be borne in equal shares by the Admiralty and the contractor.

The specification states :—All those parts of the works required to be carried out in the dry, whether within any part specially specified to be enclosed or in the ordinary course of the work, must be kept free from water at all times to the entire satisfaction of the superintending civil engineer, whether it be sea or river water, or arise from leakage through the strata, or any old work, or drainage, rain, springs, or from any other source ; and the contractor must provide all and every appliance for dealing with the water as may prove necessary.

The excavations throughout shall be kept dry and free of all sea, river, land and rainwater at all times both by day and night. The position of the contractor's main pump shall be selected subject to the approval of the superintending civil engineer, and all pumping machinery, &c., that may be required must be provided, worked and maintained in good order and efficiency by the contractor at his own expense.

The contractor (within the limits of basin wall handed over to him as shown on site plan) shall be permitted to discharge the water into the repairing basin on condition that the discharge pipes shall be carried down below surface of water in the repairing basin, and that efficient strainers are constantly used to prevent mud being deposited in the basin.

In the letter of invitation it is said :—

The contractor is to satisfy himself as to the nature of the existing roads or other means of communication and access to the works generally, the available accommodation as regards land (in addition to that comprised within the contract limits) and buildings that may be required for temporary purposes in connection with the efficient execution of the permanent works, and he is to make his own inquiries and arrangements as to additional workyard sites and depôts, and is to acquire and provide such additional sites and areas as may be necessary for temporary purposes for efficiently carrying on and completing the works generally. He must also, notwithstanding the borings, make local and independent inquiries as to the nature of the ground to be excavated. He must also form his own estimate as to the temporary pumping power and appliances required to keep any part of the works, whether specified or not, that may obviously require to be executed in the dry, free from water, whether sea, river, surface or subsoil water. He must also satisfy himself as to the sources of supply and sufficiency of all the different materials referred to in the specification or indicated on the plans, and generally he must obtain his own information on all matters that may in any way affect his tender, and it must be distinctly understood that omission on the part of the contractor to obtain reliable information on any of these points will not relieve him from any risks, or from the entire responsibility for the fulfilment of the contract to the full intent and meaning of the conditions of contract.

CHAIN CABLE GROYNES.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, March 5, Mr. Maurice Wilson, president, in the chair, a paper was read on "Submerged Chain Cable Groynes," by Mr. R. G. Allanson-Winn, of which the following is an abstract.

In his opening remarks the author stated that this paper had been prepared with the view of describing the chain cable groyne and its uses, and he dealt with the difficulties often experienced in securing examples to put sufficient life and force into a theory to secure its comprehension and acceptance. The author then urged on all young members of the profession the importance of not only learning all they can from books recording the experiences of others, but of using their best endeavours to make their knowledge

their "very own," by efforts to gain what he termed unaided solutions to troublesome problems. By that means they might avoid the danger of sliding into ready-made grooves and quenching their own originality.

The following are the main features of the author's chain cable groyne :—To a heavy chain cable are attached bushes or other suitable obstructions until the chain is converted into a veritable flexible hedge. When used on the visible shore the chain is strongly pinned down to the shore by iron bars or piles, and is laid in deeper water from low-water mark by paying out from barges or lighters. When the flexible hedge or groyne has been placed in position, seaweed and other travelling material collects in and around the hedge, and the obstruction begins to cause a slowing down of currents and to encourage the deposit of all kinds of détritus.

Dealing with the practical question of the areas which may come under the influence of groynes, the author took for example an average shore, on which the horizontal distance between high and low-water marks was 600 feet, and the distance from low-water mark to the five-fathom line was one mile. Here it was easy to realise what a large area of the invisible shore was being influenced by currents and waves compared with the visible area exposed to the sea's action with every tide.

Taking 100 feet of frontage, he said, we saw 60,000 square feet of exposed shore acted on by visible agencies, but when it came to the same width of the invisible sea bottom, constantly exposed to the unseen movements beneath the surface, we had an area of 528,000 square feet over which we knew changes were taking place and material travelling possibly in vast quantities. Reference was here made to the condition of the Dunbar foreshore, and to the troublesome situation at Bray, a description of the groynes at the latter place being given. The reality of deep sea erosion as the main factor to be reckoned with on the East Coast and elsewhere was enlarged upon by the author, who held that almost any form of low groyne securely held in position between, say, mean sea level and a point in the deeper water in the offing—to be decided upon by the particular circumstances of the case—would arrest and bring about the retention of large masses of travelling material and the covering up of exposed surfaces.

Quotations were given from various recent articles and letters referring to the origin and utility of low groynes, and the conclusion of the paper was devoted to a description of various sections of the East Coast sea bed, taken over certain lines from charts dating back to 1824, and in one case even to 1806, the comparison of the older sections with those of the present day fully bearing out the author's contention as to the deep sea erosion, and consequent advance of deep water landwards.

CANAL COMMISSION.

THE King has been pleased to appoint a Royal Commission to inquire into the canals and inland navigations of the United Kingdom and to report on

1. Their present condition and financial position;
2. The causes which have operated to prevent the carrying-out of improvements by private enterprise, and whether such causes are removable by legislation;
3. Facilities, improvements and extensions desirable in order to complete a system of through communication by water between centres of commercial, industrial or agricultural importance, and between such centres and the sea;
4. The prospect of benefit to the trade of the country compatible with a reasonable return on the probable cost;
5. The expediency of canals being made or acquired by public bodies or trusts and the methods by which funds for the purpose could be obtained and secured, and what should be the system of control and management of such bodies or trusts.

The following are the Royal Commissioners :—The Right Hon. Lord Shuttleworth, chairman; the Lord Kenyon; the Lord Brassey, K.C.B.; the Lord Farrer; the Right Hon. Sir John Dorrington, Bart.; Sir John Brunner, Bart., M.P.; Sir Francis Hopwood, K.C.B., C.M.G., Permament Secretary to the Board of Trade; Mr. W. J. Crossley, M.P.; Mr. Russell Rea, M.P.; Mr. J. F. Remnant, M.P.; Mr. P. Snowden, M.P.; Mr. Henry Vivian, M.P.; Mr. L. A. Waldron, M.P.; Mr. R. C. H. Davison, C.E.; Mr. J. P. Griffith, C.E.; Dr. A. J. Herbertson; Mr. J. C. Inglis, C.E.; Mr. H. F. Killick and Mr. John Wilson. Mr. W. B. Duffield, M.A., barrister-at-law, will act as secretary.

We notice that important alterations, accelerations and additions will be made from March 1 in the London suburban train service serving the Aylesbury and Chesham lines. The Marylebone terminus of the Great Central Railway is the pivot around which the perfected facilities will operate. As is well known, Pinner, Northwood, Amersham, Chesham, Aylesbury, &c., have for years been popular residential centres, but it must be admitted the

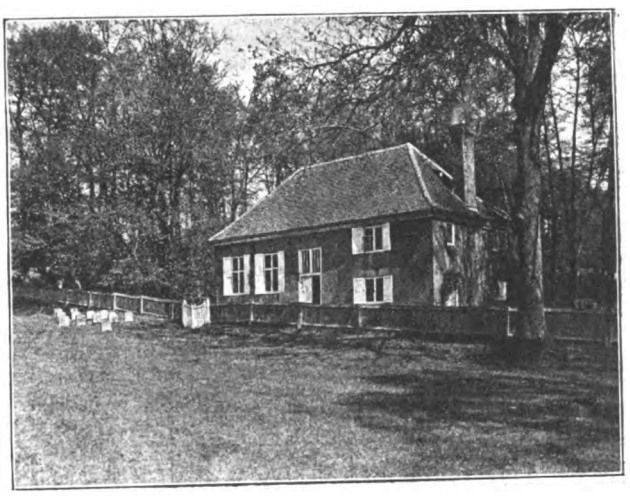
train service hitherto provided has been inadequate. The enterprise of the Great Central Company in building new stock, comprising eight-wheeled first and third-class carriages with most comfortable interiors for use on the new service, together with important accelerations and additions of trains, is sure to meet with success and develop the districts. From March 1 Marylebone station will also be the centre of the inauguration of a new suburban route for the London traveller. The new line from Neasden to



MILTON'S COTTAGE.

Akeman Street, passing through South Harrow, Beaconsfield, High Wycombe and Princes Risboro, at present only open for goods traffic, will on the date mentioned be opened for passenger traffic as far as South Harrow station, and on April 2 the throughout section of over 40 miles will be served by an excellent service of passenger trains. The charms of the country through which the line passes are too many to attempt at present to recapitulate, but it may be mentioned incidentally that it covers the most picturesque parts of Buckinghamshire, and embraces the homes and haunts of many men who have left their records on the

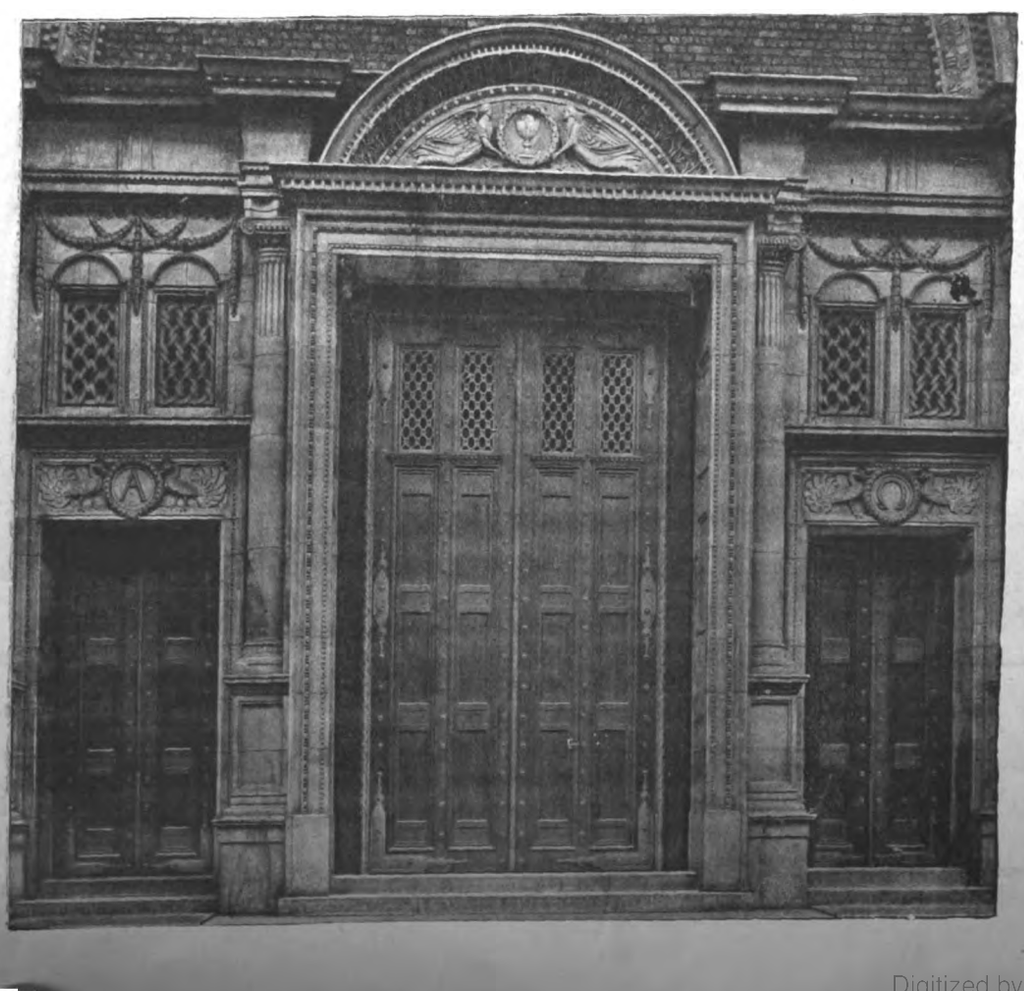
cliffs of fame—Milton, Penn, Gray, Waller, Burke, Hampden, Beaconsfield and others were all at one time associated with the several towns or villages through which the Great Central trains will shortly be running. We give an illustration of the new route and also three views of interest—Milton's House, Penn's House and Hughenden Church.



BIRMINGHAM BUILDERS' EXCHANGE.

A LECTURE was delivered at the Birmingham Builders' Exchange by Mr. J. Miller Carr on "Architectural Ceramics." Mr. John G. Dunn was in the chair. In the course of his lecture, which was illustrated by a number of cartoons and specimens of artistic pottery for building purposes, Mr. Carr said there were in Birmingham a number of important examples of the use of the ordinary colours of terra-cotta in buildings. The arcades with the malachite interiors and several fine frontages in New Street, High Street and Union Street; Central Hall, with its noble tower; Queen's College, the Y.M.C.A. and other buildings which might be mentioned were cases in point, and if they were to add to these the older examples of the Law Courts, the General Hospital and some of the frontages in Newhall Street they had a list that the city might well be proud of. He complained, however, that during the last five years, and especially during the last three years, Birmingham had not, in the matter of decorative architecture, acted up to its motto of "Forward." There had been such feverish anxiety in all the more important buildings to make the work cheap that they had omitted to make it nice, and had not attained to that desirable quality expressed by the French word *distingué*. As far as architectural ceramics were concerned Birmingham had only touched the hem of the garment. Dealing with new uses to which terra-cotta might be turned, Mr. Carr said that some years ago he was asked if he could not apply the methods of manufacture of slab mosaic to the purpose of putting a representation of Warwick Castle on to an old wall about 30 feet by 15 feet. He at once replied that it could be done with striking effect, and in order to carry out the idea, he put a tracing over a steel engraving of the castle, subdued all the worrying details, and expressed the subject by just a few broad fields of colour separated by broad outlines. The lecturer gave instances of other directions in which this principle might be applied. By the use of simple means coupled with artistic designs it was possible to express in a permanent and architectural way on the exterior of a building the purpose of any kind of manufacture or business that might be carried on within. Had they not got nearly tired of the vulgar attempt to shout each other down on the part of shopkeepers by each striving to put larger letters across his front than his neighbour could? After all, the shopkeeper only proclaimed his name, but it would be much better if he could make his building itself to declare his craft. The walls of many of the principal hospitals in the country had within the last few years been enriched and rendered almost vocal by illustrations of various nursery rhymes painted on the tiles. The primary object in such cases was to effectively tell the story, but still to do it in such a way that the panel should be manifestly a part of the wall. Concluding, the lecturer did not deny that Birmingham had progressed architecturally. He remembered the ramshackle rookeries which existed twenty-five years ago where Corporation Street now stood. Birmingham was, indeed, a fine city, but it was only a body—well laid out and compact. If it could attain to the dignity of a soul, what possibilities there were. The city might be the Venice of to-day. There was no need to go to Italy for marble or to Venice for glass. Birmingham had far richer colours at its command, and in wares that would stand the local climatic conditions better than anything brought from abroad. On the motion of Councillor Tonks, seconded by Mr. J. C. Nicol, a vote of thanks was passed to Mr. Carr.

THE German Consul in Seattle draws attention to numerous projected irrigation works in the Western States of America. Congress has voted over 6,000,000*l.* towards the cost of irrigation, and a first instalment of 1,000,000*l.* has been paid. The tracts to be watered consist to a large extent of private land, and only in certain instances of Government property.

A New and Important Work.

"MODERN BUILDINGS:

Their Planning, Construction, & Equipment."

By G. A. T. MIDDLETON, A.R.I.B.A.

(VICE-PRESIDENT OF THE SOCIETY OF ARCHITECTS), ASSISTED BY NUMEROUS SPECIAL CONTRIBUTORS.

THE MOST COMPREHENSIVE BOOK UPON BUILDING EVER PUBLISHED.

A Few of the Thousands of Subjects dealt with:—

PLANNING.

Domestic Planning—including Cottages, Villas, and Bungalows, Large Country Houses, Small and Large Town Houses, Flats, Shops, and Offices.
Public Buildings—including Schools, Hospitals, Libraries, Town Halls and Municipal Buildings, Public Baths.
Ecclesiastical Buildings—including Establishment Churches, Nonconformist Churches, and Supplementary Buildings.
Miscellaneous Buildings—including Theatres, Warehouses, Factories, Farmhouses, Stables, Dairies, and Bakeries.

CONSTRUCTION.

Masonry—simple and elaborate, including Domes, Vaults, and Buttresses, Traceried Windows.
Brickwork in English and Flemish Bond, Foundations, Footings, Arches, Chimneys, &c.
Carpentry and Joinery—from the roughest to the most elaborate work.
Tiling and Slating.
Plastering, Plumbing—both external and internal.
Bell-hanging—Wire Bells and Electric Bells.
Painting and Glazing—including Decorative Windows.
Shoring and Under-Pinning, and dealing with dangerous structures.

SPECIFICATION WRITING.

Model Specifications for a small cottage and for a large shop, properly arranged in all trades, with notes.

QUANTITY SURVEYING.

Taking Off—according to the three principal systems now in vogue, comparing their value under different circumstances.
Abstracting—or bringing into proper trade sequence.
Billing—and preparing the quantities for the Estimator.
Checking Accounts and Measuring Variations.

STEEL & CONCRETE CONSTRUCTION.

The Theory of Steel Construction—analytically and graphically considered.
Modern Steelwork—in Stanchions, Columns, Floors, and Roofs.
Armoured Concrete—explaining all the principal modern methods.
Fire-Resisting Construction of all kinds for large and small work.

HEATING.

Hot-Water Apparatus—for ordinary house work, in all its usual modifications.
Hot-Water Heating—on low and high pressure, including the two-pipe, the one-pipe, and other overhead systems of low pressure, and both limited and unlimited high pressure.
Steam Heating—in all its systems.
The Open Fire—particular attention being given to modern forms.

VENTILATION.

The Natural and Artificial Systems—theoretically and practically considered, with all the appliances illustrated and described which are in most general use, and the principal systems discussed.

LIGHTING.

Gas, Acetylene, and Electric Lighting—including the comparison of illuminating power and the methods of laying wires and pipes, fittings and fixtures, with a description of the plant necessary for private installations.

DILAPIDATIONS AND EASEMENTS.

Dilapidations—under the usual clauses of long leases.
Ecclesiastical Dilapidations.
Rights of Light—how obtained, and their limitations.
Rights of Support, &c.

SPECIAL FITTINGS.

For many Miscellaneous classes of Buildings, including Laboratories, Shops, Baths, &c.

Over 1,500 Illustrations in Colour, Half-Tone, and Line.

A FREE BOOKLET.

It would be impossible in this announcement to set forth the many important features of this indispensable work, but we have prepared a **Free Descriptive Booklet**, which we shall send you post free on receipt of the form or a postcard.

THE CAXTON PUBLISHING CO.,
84, 85 & 86 Chancery Lane, London, W.C.

GOOD ADVICE.

Architects, Contractors, and others are recommended to journey by the

GREAT CENTRAL RAILWAY.

They will find it

RAPID TRAVEL IN LUXURY.

Each Express is VESTIBULED and has a BUFFET CAR attached available for FIRST and THIRD-CLASS PASSENGERS.

The London Express Trains centre on Sheffield, branching therefrom westward to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool; northward to Huddersfield, Halifax, Bradford, Leeds and York; eastward to Doncaster, Grimsby, Hull and North Lincolnshire.

Cross Country Expresses and Through Arrangements with other Companies are a distinct feature of the Great Central services. Liverpool, Manchester, and Sheffield are linked up by corridor trains with Lincoln, Harwich, Lowestoft, Norwich, and the Great Eastern system.

Newcastle, Sunderland, Durham, York, Bradford, Huddersfield, Rotherham and Sheffield are provided with through trains *via* Nottingham, Leicester, Banbury and Oxford, to and from Southampton, Bournemouth and the South-Western Line.

Bath, Bristol, Exeter, Torquay, Kingswear, Plymouth, and the Cornish Riviera are reached by Express Trains from Leeds, Wakefield, Halifax, Huddersfield, Sheffield, Nottingham, and Leicester.

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. off ordinary fares.

HACKNEY JOINERY, LTD.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

RIO DE JANEIRO.—May 31.—Plans for the construction of National Congress building. Three prizes of 15,000, 10,000 and 5,000 milreis will be awarded to the three best designs. Wrexham.—March 31.—For the erection of a chapel in Victoria Road. Mr. Ivor H. Jones, Johnstown, Ruabon.

The convener of the municipal buildings committee of the Glasgow Corporation has agreed to continue for a week a minute which recommended the approval of plans for the proposed reconstruction of the municipal buildings in Cochrane Street, to the west of the Sanitary Chambers, at an estimated cost of 99,000*l.* The plans were prepared by the city engineer.

Borings were recently made at Khartoum for the purpose of obtaining an alternative water supply to that derived from the Nile. According to the *Glasgow Herald*, sweet water has been discovered in the surrounding desert at a depth of 50 metres, none above that depth being free from salt or brackishness, and the borings have given such excellent results that five artesian wells have been sunk and waterworks are being laid down for the improvement of the Khartoum supply. A pumping plant is in course of erection. The principal tank is designed with a capacity of 750 tons of water, this weight being needed on account of the great pressure required to drive water through the mains for the distance of two and a half miles the water has to travel for its distribution. The pumps are of the Hayward-Tyler "plunger" pattern, there being three sets of these of three each. The water tower is to be approximately 110 feet in height. Filters will shortly be erected, and both ironwork and machinery are thoroughly up to the latest modern standard. The total cost of the waterworks and plant when completed will, it is stated, scarcely exceed 30,000*l.*, this amount being, however, exclusive of the cost of the pipes and laying them down.

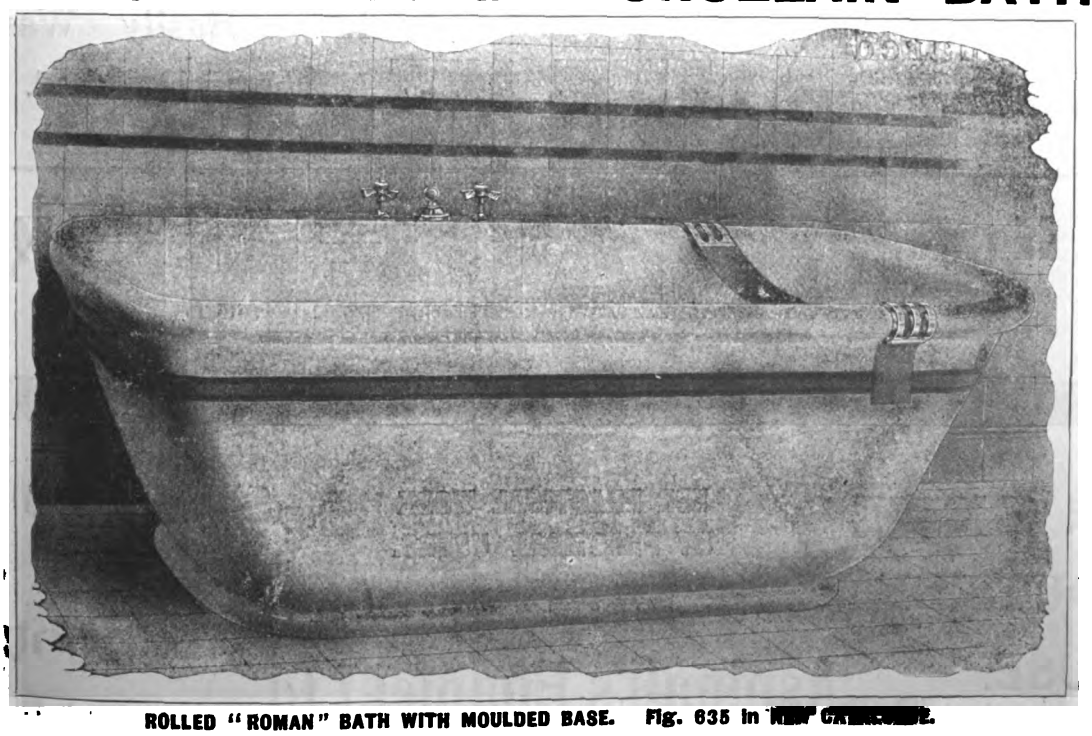
NOTES ON NOVELTIES.

MESSRS. G. WOOLLISCROFT & SON, LTD., tile manufacturers, of Hanley, Staffs, claim to have settled the vexed question of secure fixing. It will be seen by the accompanying illustration that the means of backing is a ribbed backing of the nature of a herring-bone, and from the appearance the tile should be absolutely rigid in its place. The tiles are produced practically in any colour, the cost being about



the same as glazed bricks. Messrs. Woolliscroft also manufacture the patent grip roofing tile and lath, the use of which precludes the necessity of nailing, and the use of such a system of roofing is inexpensive and absolutely durable. Some important work has been entrusted to the firm in red, buff and terra-cotta, and a further branch of their work is in mosaics. A beautiful specimen of this is to be seen on the walls of Armagh Cathedral.

TRADE NOTES.

THE Chester-le-Street small-pox hospital is being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. CARTER & Co. have, in order to meet the increasing demand for white glazed wall tiles, opened new works, known as the White Works, Hamsworthy, Poole, for the special manufacture of these goods. The premises are of considerable extent, and fitted throughout with the latest up-to-date machinery and labour-saving appliances, which will enable the firm to promptly execute the largest orders which may be entrusted to them.

THE Alphons Custodis Chimney Construction Co., of 119 Victoria Street, Westminster, S.W., have secured the contract for the erection of the chimney, on their patented system, to the Southern Sewage Works for the borough of Ealing. Messrs. Babcock & Wilcox have also placed an order for a chimney-shaft of special design in connection with the South Metropolitan Electric Light and Power Company's electricity station at East Greenwich, and the company have also received the chimney-shaft contract for Messrs. Marriage & Son's large new flour mills at Felixstowe, as sub-contractors to the well-known builders, Messrs. Cubitt & Co., of London.

THE Horsfall Destructor Company, Ltd., of Leeds and London, have recently signed a contract for the supply of a four-cell Horsfall patent destructor for the Municipal Commissioners of Singapore, Straits Settlements. This destructor, which will be of the latest type, is an extension to an existing plant erected many years ago in the city of Singapore. The Horsfall Company have also secured the contract for a four-cell destructor with two Babcock & Wilcox boilers, buildings and chimney complete for the burgh of Dunoon, a well-known seaside resort on the Clyde.

MESSRS. TABOR, TREGO & CO. (1902), LTD., have removed their City offices from 42 New Broad Street to 41 Bishopsgate Street Within, E.C. This, we are informed, is their second change of address during the eighty odd years the firm has been in existence, and, curiously enough, in both instances the removal was necessitated by the demolition of their premises for City improvements. To many of their old customers the reassociation of Messrs. Tabor, Trego & Co. with Bishopsgate will awaken familiar memories, for in that thoroughfare they were originally established, and for over half a century uninterruptedly carried on their business of varnish and japan manufacturers.

MESSRS. CAMMELL, LAIRD & Co. officially announce with regard to recent frequent revived rumours that they intend to establish works in South Wales, that they have under consideration for the extension of certain sections of their work sites in South Wales and also on the East Coast.

ELECTRIC NOTES.

THE Radcliffe District Council have instructed the electrical engineer to prepare and submit to the next meeting of the electricity committee a scheme for reducing the prices for lighting and power.

A LOCAL GOVERNMENT BOARD inquiry has been held at Sunderland into an application by the Corporation for sanction to the borrowing of 18,000*l.* for electric-lighting purposes. Extensions of the works are needed in order that the increasing demand may be supplied.

AT the last meeting of the Grimsby Town Council the acceptance of tenders totalling some 8,000*l.* for electrical extensions was opposed, despite the fact that the Local Government Board had sanctioned the extensions. The tenders were accepted.

THE special committee of the Sheffield Corporation appointed to consider the cost of production of electrical energy at the electric light and tramways power stations respectively, and as to the utilisation of waste steam available at the refuse destructors for the generation of electricity, recommend that Sir William Preece, K.C.B., F.R.S., be retained to advise the committee at a fee not exceeding 100 guineas.

THE Folkestone Corporation on Tuesday adopted an agreement consenting to a system of tramways to Cheriton, Sandgate and Hythe, for which the National Electric Construction Company are this session seeking Parliamentary powers. The company is to pay the Corporation 16,200*l.* immediately for certain considerations, the amount, however, to be returned with 5 per cent. interest should that part of the Bill relating to Folkestone be rejected.

AT the meeting of the Wolverhampton Town Council on Monday the electricity committee submitted a report stating that in 1903 the Local Government Board authorised the borrowing by the Council of 1,000*l.* for meters and indicators, and in September 1904 they sanctioned a loan of 10,000*l.* for the extension of the mains. These sums have been overspent, and the committee recommend that sanction be sought for raising a further loan of 10,000*l.* for further extension of the mains, and 2,000*l.* for the purchase of meters and indicators.

SIR H. CAMPBELL-BANNERMAN, having been asked whether, in view of the number of Bills for the supply of power to different parts of the metropolitan area which are before Parliament, or likely to be before Parliament in the near future, he has considered the advisability of appointing a Royal Commission to inquire into the whole subject, and whether he is able to announce any decision in this respect, replied that there is no intention of appointing a Royal Commission on this question.

THE Leeds tramways are expected to realise a net profit of over 84,000*l.* for the year ending the 31st inst., the total receipts being estimated at 300,000*l.* 52,000*l.* will be voted to the relief of the rates, against 55,000*l.* last year. The gross profit last year was 136,000*l.* and the net profit 83,000*l.*, of which 28,000*l.* was set aside for redemption fund; 1,200,000 passengers are carried every week against 3,000,000 on the tramways of the London County Council.

THE scheme for a municipal electric lighting undertaking at Macclesfield has been abandoned. Twelve months since the Council approved a small scheme, the cost of which was not to exceed 16,000*l.* Three weeks ago a Local Government Board inquiry regarding the borrowing of the money was held. The inspector indicated that he considered the scheme was on too small a scale. At the Council's meeting it was resolved not to proceed any further with it.

THE tramways committee of the Lancaster Town Council recommended that a proposal to lease the electric lines in the borough by an outside company be rejected, but they were prepared to give facilities to the company so that they might acquire the horse tramway undertaking, and so end the deadlock that has existed for some time and prevented the Corporation from carrying their line to Skerton. It was decided to defer the matter to a special Council meeting.

A DEPUTATION of members of the Liverpool Commercial and Traders' Council last week waited on the tramways and electric power and lighting committee in reference to the price charged for electricity. It was contended that the time had now arrived when a substantial reduction ought to be made in the price charged to consumers in Liverpool dating from January 1 last. In Liverpool 3¾*d.* per unit was charged for a consumption up to a minimum of 3,000 units per quarter, and after that the price was 3*d.* per unit.

AT a meeting of the Birmingham Electric Club on Saturday, Mr. R. G. Mercer read a paper on "The Use of Electricity in Mines." He stated that electric haulage had doubled the output of one company's mines, and had reduced the cost of traction from 4*d.* to ½*d.* per ton, and effected a total yearly saving equivalent to 30 per cent. on the outlay of the electrical plant, so that in about three years the latter paid for itself. In another case, where mule haulage was used, the substitution of electric locomotives reduced the cost of traction from 5*d.* to ½*d.* per ton, and effected an annual saving equal to 90 per cent. of the cost of electrical installation.

THE Board of Trade have published the report of Lieutenant-Colonel P. G. Von Donop, R.E., as the result of his inquiry into the circumstances of the derailment of a passenger train on the Great Central Railway in Cahasby tunnel. The inspector draws attention to the fact that three of the vehicles were lighted by gas; all the lights in these were at once extinguished, and there was a great escape of gas. Fortunately the officials took prompt measures to keep all naked lights away from these vehicles. Danger was thereby averted, but "it is terrible to contemplate what might have been the results of this accident if an explosion had occurred or a carriage had caught fire in the tunnel. The leading and rear vehicles of the train were both lighted by electricity. The lights in the latter were extinguished, but in the former vehicle they remained alight throughout, and were of the greatest assistance in rescuing and controlling the passengers."

VARIETIES.

THE Weymouth Town Council have adopted a scheme for the erection of a pavilion on the site of the present pier at an outlay of at least 12,000*l.*

THE Newcastle-on-Tyne Corporation have decided to provide a new police-station in Wharrier Street, Walker. The cost is estimated at 7,800*l.*

THE Gourock Town Council, N.B., have purchased a site for new municipal buildings. The leases of some of the tenants have still nearly two years to run.

The surveyors of the London and North-Western Railway Company are measuring the site at Colwyn Bay on which a new station is to be built at a cost of 80,000*l.*

A syndicate are conducting negotiations with the Bray Urban Council, near Dublin, for the purpose of obtaining authority to erect a pier about 1,000 feet long with pavilions at the shore end, at a cost of about 30,000*l.*

Cordingley's Motor Car Exhibition will be held at the Agricultural Hall, and will open on the 24th inst., closing on the 31st. Success is assured, as upwards of 300 firms have booked space.

A meeting of the Further Strand improvement committee is to be held in Burlington House on Monday, with the object of making a further appeal to the London County Council to alter the obnoxious building line of the Strand.

A schedule of the historical and artistic buildings and monuments of Venice has been prepared. There are entries of 114 churches and 526 palaces, with many other buildings.

Mr. H. Skryme, who for many years was head assistant to Mr. F. Kempson, of Cardiff and Hereford, has commenced practice on his own account, and has opened offices at 138 Widemarsh Street, Hereford.

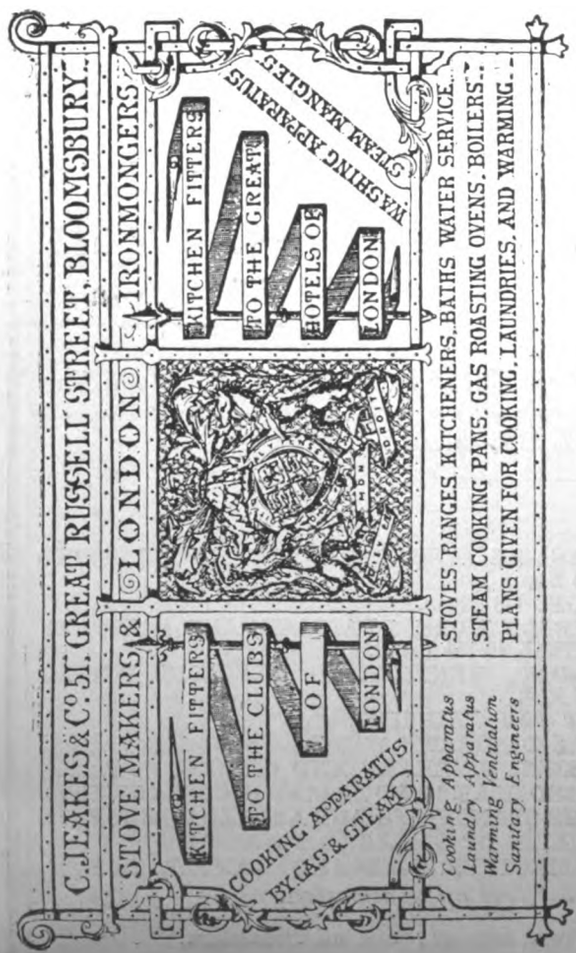
Colonel A. G. Durnford, R.E., Local Government Board inspector, held an inquiry on Monday at Ilkeston, Derbyshire, respecting a proposal to borrow 27,000*l.* for the purposes of sewage disposal. Messrs. Wilcox & Raikes, of Birmingham, are the engineers.

The Paddington Borough Council have decided to seek the London County Council's sanction to a loan of 3,000*l.* for the purpose of furnishing the enlarged town hall, Paddington Green, Harrow Road. The borrowing is to be for six years.

The Mossley Town Council have asked the Local Government Board to conduct an inquiry into certain cases of lead poisoning which are alleged to have been caused by lead in the water supplied by the Ashton and district joint waterworks committee.

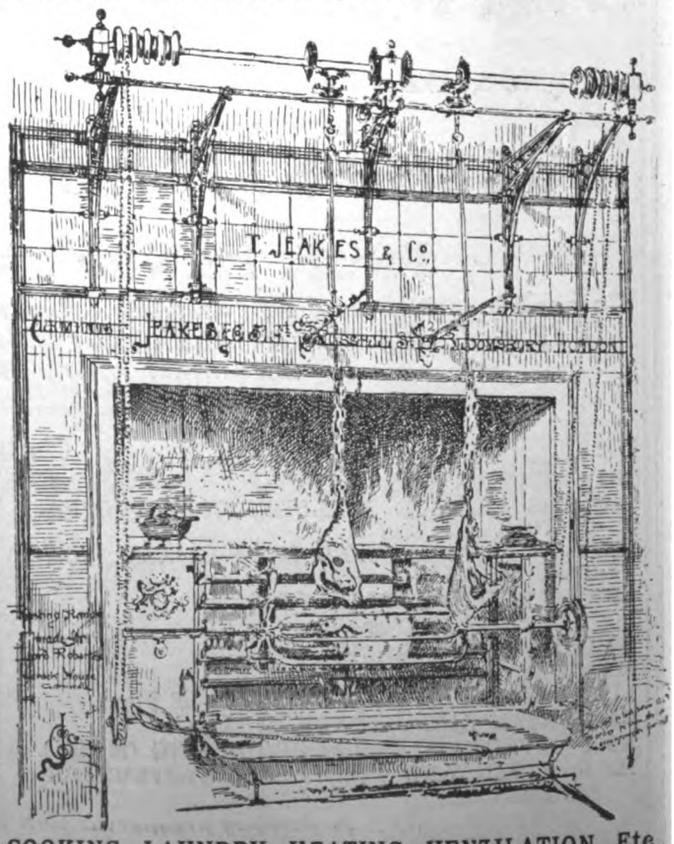
Mr. Lewis Harcourt, First Commissioner of Works, has stated that all the lands and buildings necessary for the completion and opening of the new road from St. James's Park to Charing Cross have been purchased. The foundations of the new road ought to be completed by the end of June of this year.

The Royal Commission on sewage disposal (presided over by Lord Iddesleigh), appointed in May 1898, cannot yet indicate when they are likely to bring their labours to a conclusion. But they hope to issue in the course of the summer a report on the relative value of the several artificial processes of purifying sewage which they have had under systematic examination.



The national conference on sea-defence, composed of representatives of municipal corporations and local bodies throughout the United Kingdom, held in London, received letters from the Prime Minister and the President of the Board of Trade stating that a Royal Commission is to be appointed to consider the question of the inroads made by the sea at various parts of our coasts.

An inquiry was recently held in Bradford into the death of a painter, employed at the tramcar depôt by the Corporation, from chronic lead poisoning. The jury, in finding a verdict to that effect, added that they considered there was not sufficient washing accommodation, and they recommended that the authorities be communicated with at once so that better provision might be made as early as possible.



The Devonport Town Council have agreed to purchase the water undertaking of the Devonport Water Company for 244,000*l.* Four years ago the Corporation obtained an Act for the compulsory purchase of the waterworks, but failed to agree as to the price. Protracted arbitration proceedings resulted, and the agreement now arrived at is the result of a compromise suggested by the arbitrators.

A building estate at Woodford Green offered for auction on Monday in Messrs. Kemsley's room was knocked down after keen competition for 6,000*l.* The estate comprised the freehold residence Woodford Lodge, Salway Hill, Woodford Green, and 5½ acres of land, having a total frontage of 1,700 feet to three roads, namely, the Woodford main road, the Lea Bridge Road and Fuller's Road.

The Edinburgh Lord Dean of Guild, at a recent meeting of the Guild Court, said he would like to take that opportunity to point out to petitioners, architects and builders

C. JEAKES & CO., ENGINEERS, 51, Gt. Russell St., LONDON.

COOKING, LAUNDRY, HEATING, VENTILATION, Etc.

Digitized by Google

that when a warrant was obtained from the Dean of Guild Court the work must be carried out in conformity with the warrant. If a deviation were required, a plan must be lodged in the Court and approved before the work was commenced.

THE Thornaby-on-Tees Corporation are about to spend 5,000*l.* in laying out two recreation-grounds within the borough. One was presented by the late Mr. Alderman J. Richardson to commemorate the reign of the late queen. The other, presented a month ago by the Earl of Harewood, overlooks the Stockton racecourse, which is on the outskirts of Thornaby.

THE Blackpool Town Council rejected the plans submitted for the erection of a canvas village in which it was proposed to live the simple life on land at South Shore during the holiday season. The reasons given for the rejection were that the plans did not show sufficient protection against fire, and that the project would be a nuisance and detrimental to the neighbourhood.

THE Hawick Town Council have resolved to offer the mansion house in Wilton Lodge public park to Hawick Archæological Society for a museum and picture gallery on terms to be mutually arranged. In the event of the Society accepting the offer, the Town Council, as trustees of the Buccleuch Memorial Science and Art Institute, will grant the present museum-room there to the School Board for science and art classes, so that the whole of that building might be under the control of the School Board.

MESSRS. G. MACKAY & SON, Edinburgh, contractors, have received the contract for carrying out a scheme of main sewerage and sewage disposal for Bentley with Arksey, Doncaster. The works consist in the laying of nine miles of main sewers of cast-iron and fireclay pipes. The district will be divided into three sections, each with a separate pumping station. The works have been designed by Messrs. D. Balfour & Son, consulting engineers, Edinburgh and Newcastle-on-Tyne.

THE directors of the Weston-super-Mare Grand Pier have entered into a contract for extending the structure a distance of 350 yards with a landing stage at the end. The contract has been given to Messrs. E. C. & J. Kay, of Birmingham, and the work is to be proceeded with forthwith, in order that the extension may be completed by the second week in July. The pier will then be nearly half a mile long. The extension will be carried out strictly in accordance with the original plans and drawings, and the contract will involve an expenditure of some thousands of pounds.

THE Board of Trade returns of the oversea commerce for February show that the expansion in the values of imports and exports continues. The value of the exports was 28,781,123*l.*, which exceeded the corresponding amount by 13·5 per cent., the actual increase being 3,512,060*l.* Iron and steel lead with the huge increase of 754,222*l.* The recent rise in prices accounts for much of this, but the quantity also rose by 67,600 tons. Railway building and extension in many different parts of the world are also partly responsible.

THE Burnley Town Council have decided to carry out the St. James's Street improvement scheme. This will mean doubling the width of the main thoroughfare in the centre of the town. The land and property required to make the improvement has cost 51,000*l.*, and the Corporation are hoping to get 30,000*l.* in return for land that will be available after the street is widened, leaving 21,000*l.* as the net cost of the improvement. A portion of the land has been let to a syndicate for the erection of a new theatre.

THE Prussian Government, with the Society of German Portland Cement Manufacturers, is offering prizes of a total value of about 750 dols. for essays on "The Chemistry of Cements." The topics to be considered are the following:—First, to prove whether silicic acid, alumina and oxide of iron combine with lime as crystalloids in stable proportions or as colloids in varying proportions; second, to prove whether double combinations result between silicic acid, alumina and oxide of iron with lime, and in what manner these substances take part in the hardening process; third, consideration of the swelling phenomena which accompany the hydraulic hardening; fourth, consideration of the influence of the temperature and the duration of the burning process on the different kinds of hydraulic cements; fifth, properties of puzzolana and its hardening with lime. The papers must be written in German, and be delivered under

a *nom de plume* to the Minister of Public Works of Prussia before the close of the year.

The rivers committee of the Manchester Corporation on Monday discussed a proposal to modify the scheme for the construction of second contact bacteria beds at the sewage works. The first contact beds are at Davyhulme, and when the original scheme was drawn up the committee were unable to acquire further land at the same site, and it was decided to construct the second contact beds at Flixton and Carrington, and to connect the two by means of conduit pipes. The committee, however, have since been able to obtain more land at Davyhulme, and now propose to construct the new beds in proximity to the existing beds, and so avoid the expense of laying several miles of conduit. The committee already have sufficient borrowing powers to the amount of 400,000*l.* to carry out the work. The cost of the new works will be about 83,000*l.*, but the change of plans will effect a saving on the original estimate of something like 100,000*l.* The committee decided to recommend the Council to apply to the Local Government Board for powers to carry out the proposed new scheme.

The parks committee of Edinburgh Town Council have considered an application by the promoters of the proposed Scottish National Exhibition at Edinburgh in 1908 for the use of Saughton Park as a site. It is understood that certain conditions will have to be agreed to by the promoters before the committee could see their way to recommend the Town Council to grant the use of a portion of the park. These conditions are that the promoters should be prepared to undertake an outlay representing 7,000*l.* on certain items of work which would not only be useful in connection with the exhibition, but which would also remain as improvements of permanent value to the city. A bridge over the Water of Leith, the erection of a band stand and the making of the river suitable for boating at that point, were mentioned as among the items which the committee thought the promoters might carry out.

The refuse destructor which has been built for the King's Norton District Council at Lifford was officially opened on Tuesday, although it has been in working order since October. It has been built under the direction of Mr. Cross, the surveyor, by Messrs. Heenan & Froude, of Manchester and Worcester. The building and machinery cost about 14,000*l.* The destructor is so arranged that the only outlet for the fumes and smoke is the tall chimney. All vapour is drawn by fans into the furnace. The heat produced by the combustion of the dust and ashes is utilised for making steam, and it is expected that from this source there will be an income of 1,500*l.* or 2,000*l.* An arrangement has been almost completed with a syndicate representing three electrical firms for using the steam from the destructor in generating electricity for lighting and power purposes. The syndicate proposes to put down plant near the destructor. An agreement is to be entered into whereby the syndicate will take over the powers possessed by the Council under their electricity order for a short period, and will guarantee at least 500*l.* a year for the use of steam. The clinker taken from the furnaces after combustion will be used for making roads and paving of the asphalte type which is largely used in the district.

GAS AND OIL-ENGINES.

One of the most important amalgamations of a commercial and engineering class is the acquirement of the business of J. E. H. Andrew & Co., Ltd., the sole makers of the "Stockport" gas-engines and suction gas plants, by Richard Hornsby & Sons, Ltd., of Grantham, whose reputation can be described as world-wide. Richard Hornsby & Sons, as manufacturers of oil-engines, have considered the possibility of also producing gas-engines and suction gas plants. After careful investigation they came to the conclusion that the latest designed "Stockport" gas-engines and suction gas plants were the best all-round engines on the market. Henceforth they can be obtained if possible under more advantageous conditions than formerly. They will be known as the "Hornsby-Stockport" gas-engines and the "Hornsby-Stockport" suction gas plant. The Stockport works will be carried on as before, but the headquarters for all business will be at Grantham, where the Hornsby works have an immense area. There are over 12,000 of their oil-engines in daily use, and the gas-engines number over 11,000. These figures suggest the magnitude of the business now brought under one control.

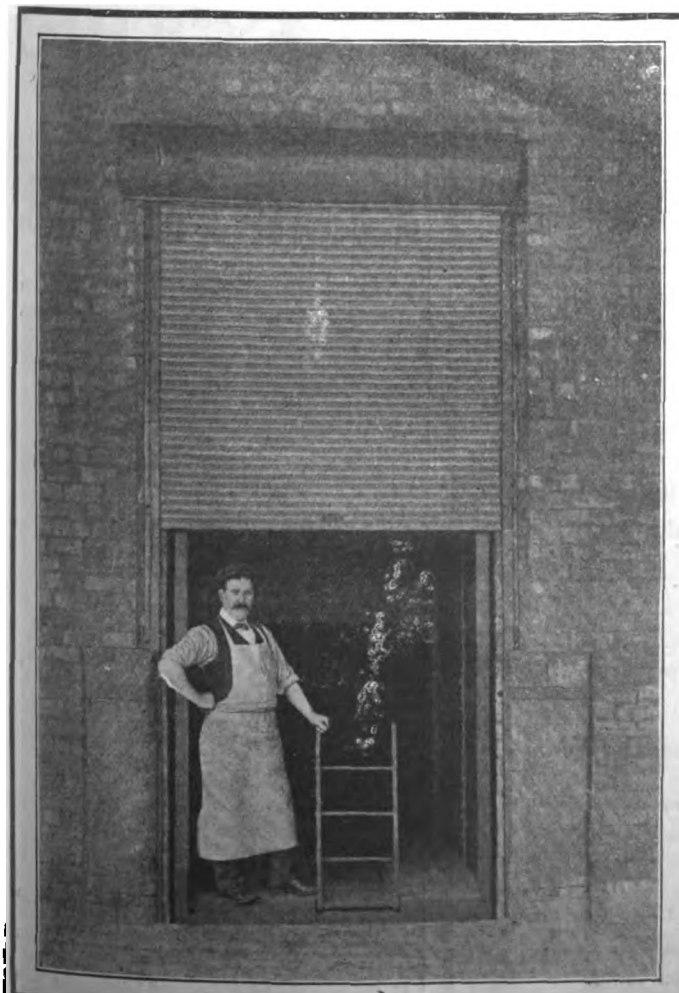
NEW CATALOGUES.

WE have received from Messrs. Robt. Jenkins & Co., of Rotherham, their new catalogue, and in sending it to us they call attention to the fact that they have now been established as boilermakers for fifty years. The catalogue contains illustrations and prices of all classes of wrought-iron, steel and copper boilers, and is produced in a handy style for reference.



THE Consett Iron Co., of Consett, co. Durham, send us their list of pig-iron, steel plates, steel chequered plates, sectional steel tee bars, &c. The company are also makers of firebricks, boiler settings, &c.

THE catalogue of Messrs. A. & P. Steven is produced in a manner which is creditable to Glasgow. The illustrations show the extensive works and clear representations of the varieties of lifts which are constructed in them. The firm has existed for more than fifty years, and has mainly been confined to lifts and hydraulic machinery. Now electricity is also employed as a motive power. The electric passenger lifts are of the drum type, under-driven, controlled by switch in car, a drum type with gear overhead, and a third with push-button control. The firm have special steel safety catches, which are advantageous should ropes break or stretch. There are also high-pressure and low-pressure passenger lifts, and numerous goods lifts, and a dinner lift suitable for loads up to 56 lbs. Messrs. Steven also produce pumping engines, high-pressure accumulators, hydraulic presses, valves, &c. The ornament of the cars deserves commendation. A hydraulic crane is shown which is fitted with a patent balance controlling valve.

ELECTRICITY AND FIRE RISKS.

A PAPER was read last week at a meeting of the Insurance and Actuarial Society of Glasgow by Mr. A. Lester Taylor, electrical engineer to the Liverpool and London and Globe and Royal insurance companies, on "The Modern Electrical Installation as a Fire Risk." The lecturer, who dealt principally with the matter as affecting the fire insurance companies, pointed out that the combined effect of the action of the Board of Trade, the Home Office, the electricity supply authorities and of the fire offices in making and enforcing rules and regulations dealing with the various phases of the practical uses of electricity had produced a standard of work and material in this country greatly to the benefit of the public in securing so large a measure of safety to the person and freedom from serious electrical fires. Parallel with the great stride which the development of the electricity supply industry was making, this important work of standardisation was being continued by the bodies named, and practical results of joint conferences now being held in London would shortly be made public. The attitude of the Government authorities was that of attaching material responsibility to those seeking powers to establish a public supply of electricity, recent legal decisions having settled that an electric supply authority was responsible under the Electric Lighting Acts and the Board of Trade Regulations for damage to person or property, and for nuisance through occurrences originating on their works (such as street mains and the like), and that it was not necessary to prove or even to allege negligence, the simple proof of the connection between their works and the damage being all that was required. The effect of this was important both to the public and to the fire offices in directly leading to excessive care on the part of the electric supply authorities to prevent or to diminish the effect of faults upon their street mains and other works. Among other matters dealt with, the substantial safety from fire risk above all other means of artificial illumination of a properly fitted electric-lighting installation was mentioned.

THE Berwick Town Council have received a letter from the Local Government Board sanctioning the granting of a lease of the building site in Bell Tower Close, adjoining the Edwardian walls. In connection with the matter, the Local Government Board had representations made to them to refuse sanction. They held a public inquiry, when the proposed lease was opposed by the Rev. James King, on the ground that the fosse connected with the Edwardian wall would be partly obliterated. The site adjoining that portion of ground has been retained by the Government.

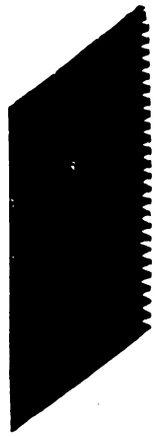
THE CRAIG OZONE GENERATOR.

It is not uncommon for people who encounter large masses of decaying seaweed to imagine that they are inhaling one of the constituents of health—which is ozone. They may have heard that the word "ozone" means an odour. But as we all know to our cost, there are odours and odours. What is known as ozone to men of science can only be obtained by the operation of electricity on pure oxygen gas. To obtain a supply of ozone not only in hospitals but in private houses and in other places where the purification of the air is desirable is, therefore, an acquisition of the utmost importance. The ozone generator of Mr. J. Richardson Craig, jun., 145 Bath Street, Glasgow, has been tested, and is found to produce extraordinary results. The city analyst ascertained that when working at full speed (passing 12,000 cubic feet of air per hour) there were produced 53.6 milligrammes of ozone per 100 cubic feet of air, and at half-speed (passing about 6,000 cubic feet per hour) 73 milligrammes of ozone per 100 cubic feet. The figures have been confirmed by Professor Glaister, of Glasgow University. The ozone is created by the operation of an electric current on air which is drawn or forced through the generator. The discharge can be regulated so as to meet the conditions of the atmosphere in the place containing the generator, which therefore becomes an aid to any system of ventilation which is employed.

Craig Ozone Generator.

The appearance of the generator can be inferred from the illustration. The inner arrangement is adapted to secure safety as well as efficiency, and complies with all

"MAXIMUM LIGHT GLASS."



LENSES AND PRISMS COMBINED IN ONE SHEET.

ABSOLUTELY THE BEST FOR DAY-LIGHTING DARK INTERIORS.

Increases the Daylight from 5 to 20 times.

By reason of a lens surface running vertically on the outside and at right angles to an interior prismatic surface, this glass possesses a double refractory power.

All the light from the sky is gathered, projected, and completely diffused.

The use of the "Maximum Light Glass" lessens the cost of artificial lighting.

Supplied in ordinary window-glass sizes.

Also in ornamental designs in lead or copper.

the requirements of fire-insurance offices. In the working less current is consumed than by an ordinary 32 candle-power incandescent lamp. In other words, such a generator as would serve for a private house would produce a continuous supply of ozone during 24 hours at a cost of about 1*d.* for current.

SMALL GERMICIDE AIR FILTER AND OZONIZER.

An allied invention is a Craig's "Germicide Air Filter," which, as the title suggests, sterilises all micro-organisms which come in contact with the filters. It is not possible to make clear the merits of the inventions by any written description. An examination of them will suggest their scientific value and their adaptability to effectually purify the air in places where there is a need of that kind, or, in other words, wherever human beings assemble.

PAINTERS' DECORATION.*

IT is conceded that the decorators of a country are its instructors in art and decoration, although sometimes questions of finance may compel them to suggest and adopt a scheme of decoration which could not be considered of the highest artistic merit. In general, the people are beginning to realise that a little knowledge of decoration is quite as dangerous as a little knowledge of other things, and there is an effort to get away from the cheap and vulgar devices which have been distasteful and an eyesore so long, and to be guided in these matters by the decorator. This is very noticeable in our city, where there is certainly a desire on the part of the public for something better in the matter of decorations.

The situation to-day requires on the part of the decorator a man bold enough to suggest the best treatment for the apartment he has in hand to decorate, not being afraid to ask a reasonable price for his work. A popular treatment from which results both pleasing and decorative can be obtained is the wall-paper with a crown frieze; yet a large number of decorators object to them, giving as a reason that they cannot get a fair price for this class of work. I do not think this is the case, for I have found with very few exceptions the public is willing to pay the price when you can show them they are receiving value for the money expended.

The subject of adorning a house requires a special study of the various styles and colours so as to obtain a pleasing and appropriate harmony. The main aim of decorating and furnishing is the production of perfect

repose. Such repose is produced by the mutual harmony in the decorating of walls and ceilings and whatever the room contains. Colour bears, perhaps, the largest part in the production of perfect repose in a room, and the decorator should keep in mind how essential it is that a proper colour treatment should be used, so that the room when completed will not be spoiled with colours that do not harmonise one with the other.

Getting down to the root of the subject, we must admit that there are no laws of interior decoration other than those of good taste, which must be intuitive to be appreciated. A true feeling for the artistic is a gift not in the possession of all, yet it is possible to give such suggestions and advice to the average man or woman in the way of selecting decorations so as to make the home pleasant and artistic also. The proper way to decorate a room is first to decide upon the design and general scheme of colour. The colours of an apartment should not be chosen arbitrarily, but with definite reason.

The following are a few of the general principles upon which colour schemes are founded and chosen. We will first consider light and size. The amount of light and size of the room are perhaps the chief factors in determining its colour. Rooms facing the north, with north light, whitish to bluish in colour, require to be decorated in luminous tints, ranging from orange to warm red. On the other hand, rooms with a southern exposure should be decorated in tints ranging from greenish yellow to blue, because the south light has yellow and purple in it. Rooms facing east and west are most effective when decorated in yellow tones, as east and west lights have yellow and purple in them.

We will next consider the character of the room. The character of the rooms themselves often determines their colourings. For example, we may consider the various rooms of the house, beginning with the hall. This to the house bears the same relation as the trunk of a tree to its radiating branches. The hall, therefore, should be decorated in strong, dark colours, while the other rooms may range from strong tones for the library and dining-room to the lighter tints for bedrooms and dressing-rooms. Pompeiian red, dull yellows, russet browns and tans are suitable for hall decorations. In libraries rich hues are necessary, such as reds, browns, olive greens and deep blues. For dining-rooms the warm colours, such as soft reds, bright greens and browns are frequently used. Tapestry papers are also effective, especially some of the finer examples of fruit and scenic tapestries. The drawing-room and reception-room are best decorated in light tints in shades of green, rose, ivory and yellow. In bedrooms and dressing-rooms self-tones of the softer shades are very appropriate. Floral designs on a white or cream background are also suitable, as they give an apartment a cheerful and inviting appearance.

We will next consider the woodwork as a guide. We have two rules to follow in this case, namely, to treat the walls in a self-harmony in the colour of the wood itself, or to use colours which contrast with the woodwork. In following the latter course it is very important that the contrasts should not be of so violent a character as to be objectionable. The amount of woodwork should also be considered, as a room with a lot of door and window frames will not stand as strong a colour contrast as a room in which the wall space largely predominates.

We must also consider the walls as a background for pictures. The colour that agrees best with all classes of pictures is a maroon red. For a room in which water-colours only are to be hung a sage green is the best. For oil-paintings a bright red makes the best background; for engravings and etchings either green or red is very satisfactory. Rooms in which the walls are to be almost covered with pictures are best treated in plain colours, as a pattern is liable to detract from the pictures themselves.

At the general meeting of the Surveyors' Institution on Monday, Mr. W. Woodward said that Parliament ought to pass an Act to prevent the enormous outlay on tramways which the London County Council were contemplating. The sooner the fact was grasped that lines of undeviating rigidity were a mistake and that the elasticity of route possible with a motor bus was the only right method, the better it would be for London traffic and ratepayers. He thoroughly agreed with the proposed immediate creation of a Traffic Board. It ought to be thoroughly independent and outside the control of the London County Council.

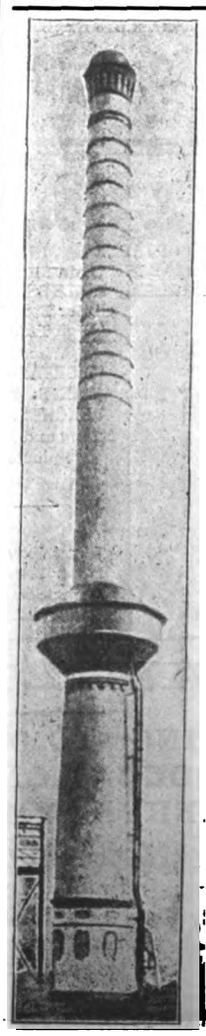
AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.



The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy Work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

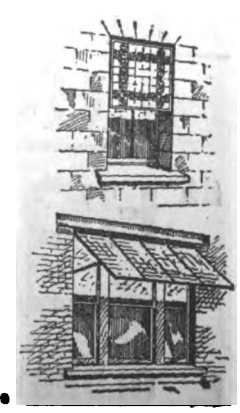
*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

RIO DE JANEIRO.—May 31.—Plans for the construction of National Congress building. Three prizes of 15,000, 10,000 and 5,000 milreis will be awarded to the three best designs. Particulars can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73 Basing hall Street, London, E.C.

CONTRACTS OPEN.



ARMLEY.—March 26.—For the whole or any part of the work in the alteration of and additions to the cemetery lodge, for the Armley Burial Board, Leeds. The office of the Board, the Cemetery, Hill Top, Armley.

ATCHAM.—March 30.—For additions to workhouse, consisting of a day-room, stonebreaking cells, bath-room, iron gangway and staircase, for the Guardians of Atcham Union, Shrewsbury. Mr. A. B. Deakin, architect, Pride Hill, Shrewsbury.

BARROW-IN-FURNESS.—March 31.—For alterations and improvements at the Thwaite Street and Rawlinson Street school conveniences. The Borough Engineer's Office, Town Hall.

LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS

AN EXPLANATION.—The Luxfer Prism is a flat-backed prism, and is the best for Daylighting dark interiors. The absurdity of any claim to the contrary can easily be demonstrated. Prisms with corrugated backs were patented by the Luxfer Company in 1897, and discarded in favour of a more perfect invention, viz. The Luxfer Prisms, that have been sold in this country during the past six years.

The British Luxfer Prism Synd., Ltd., 16 Hill St., Finsbury, E.C.

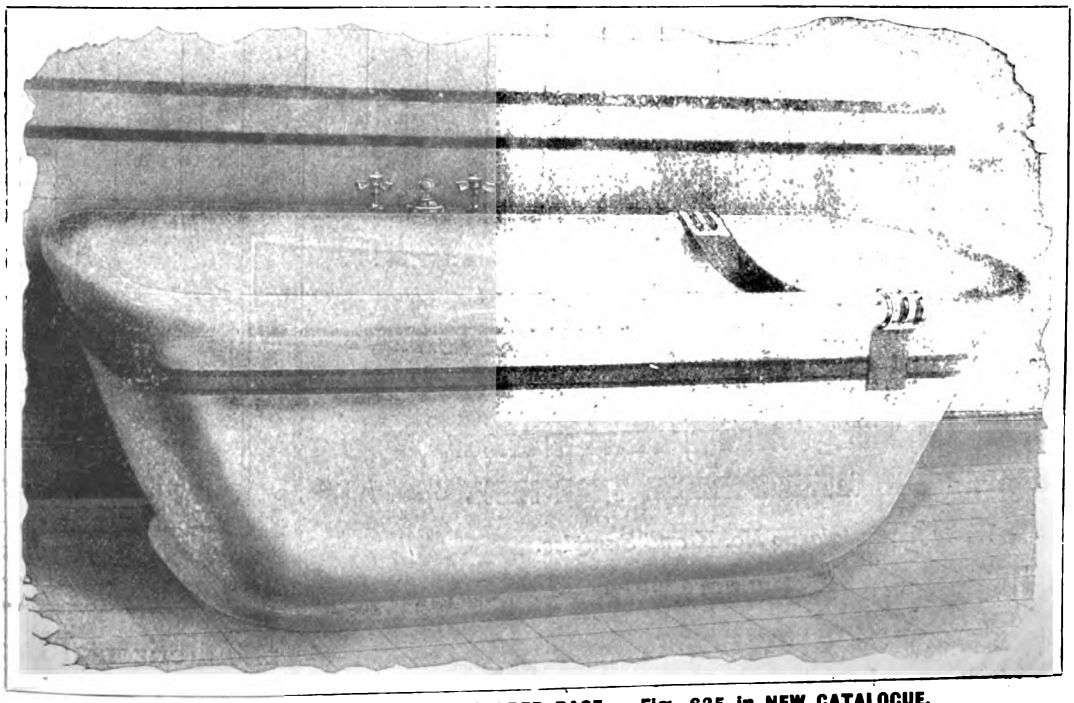
TRADE NOTES.

MR. LOUIS P. CASELLA, now Casella & Co., scientific instrument makers and mechanical engineers, have removed from 147 Holborn Bars, E.C., to 11-15 Rochester Row, Victoria Street, S.W.



HELLIWELL & CO., LTD., of Brighouse, Yorkshire, and 11 Victoria Street, Westminster, London, have received the contract for the glazing on their patent "Perfection" system to the new potato shed roof at College goods station for the North British Railway.

MESSRS. RUFFORD & CO., LTD., 30 Snow Hill, near Holborn Viaduct, have supplied a number of their Royal fireclay porcelain baths and sinks to the Reigate new swimming baths. The fire which occurred on the 14th inst. over their show-rooms has in no way affected their business.

AN outbreak of fire took place on Monday, the 12th inst., at the works of Messrs. Somerville & Morrison, Eastfield, Rutherglen, Glasgow, which might have had very serious results. Fortunately these premises have lately been protected by an installation of Mills's modified "Titan" sprinkler (1903 patent), and these immediately came into operation and extinguished the fire with very slight damage. Messrs. George Mills & Co., of Radcliffe, the proprietors of the "Titan" sprinkler, have received the following letter from the firm:—"March 14, 1906. Dear Sirs,—Fire broke out in our tarpaulin department on Monday, the 12th inst. Two of the sprinklers came into action and extinguished it in a few minutes. The sprinklers were entirely effective in their action.—Yours truly, SOMERVILLE & MORRISON."

IT is with regret we record the death of Mr. Joseph Aird an engineer who brought the manufacture of tubes and fittings to a perfection which hitherto was not attainable in this country. Mr. Joseph Aird was brother of Sir John Aird, and had the same organising power, although in his case it was displayed in a more confined field of production.

ELECTRIC NOTES.

THE Council of Armstrong College, Newcastle-on-Tyne, have appointed Dr. W. A. Thornton, who has been for seven years lecturer at this college on electrical engineering, to the newly-created professorship in that branch at the college.

THE Birkenhead Town Council have decided that application be made to the Local Government Board for sanction to borrow, under the powers and provisions of the Electric Lighting Acts and the Birkenhead Electric Lighting Order, 1890, the sum of 11,256*l.* for two water-tube boilers (2,570*l.*), steam dynamo (3,040*l.*), condensing plant (3,500*l.*), &c.

A COMPANY has been formed with a capital of 625,000*l.* with the object of constructing an electric tramway from the centre of Amsterdam to many of the more important towns and villages to the north of Amsterdam, having a total length of about 40 miles. It will have a 10-minute service, and will be an important and desirable means of transport for the district.

THE survey of an electric power scheme contemplated in the Vale of Conway has been completed. The work is estimated to cost 126,000*l.*, which has been subscribed, and will comprise the construction of a large reservoir, which will receive its supply from Lake Cwmeigian and Lake Cowlyd, the whole of the water rights of the former source and the overflow of the Cowlyd having been acquired by the promoters.

MR. H. PERCY BOULNOIS, on behalf of the Local Government Board, held an inquiry at Warrington respecting the Corporation's application for powers to borrow 10,000*l.* for electrical mains in the borough. There were many present to offer opposition, but on the amount applied for being reduced to 7,000*l.* it was withdrawn. The application was made at the suggestion of one of the Board's inspectors that the Corporation should anticipate their requirements for about three years in order to avoid frequent inquiries.

MR. DALRYMPLE, the manager of the Glasgow tramways, who was invited to visit Chicago for the purpose of preparing a report on the street railways in that city, stated that if it were found impracticable owing to excessive cost for the local authorities to purchase the system, steps should be taken to amalgamate the various companies concerned. The Supreme Court of the United States has since decided that, although the franchises have over sixty years to run, the traction companies have not all the privileges they claim. It is believed the expenditure on the acquirement of the system would be 75,000,000 dols.

THE electrical installation to be fitted on the Cunard steamer *Mauritania*, building at Wallsend, will be the largest and most complete ever fitted on board ship. The generating plant will be larger than the plant first installed in the generating station erected in Waterloo Street by the Glasgow Corporation, and equal to the electric power required for the lighting of Paisley. A large portion of the auxiliary machinery will be driven by motors, including that for lifts, forced draughts, refrigerating appliances, cooking, ventilation, telephone, &c. The electric lighting of the ship will require about 5,000 lamps of sixteen candle-power.

THE electric-lighting committee of the Town Council of Edinburgh, at their last meeting, had under consideration a report by the resident electrical engineer as to the lighting of common stairs by electricity. The question arose through two builders of tenements inquiring on what terms the authorities would be prepared to supply electric lighting for the stairs leading to the houses. The committee agreed to offer to supply the cleaning and lighting committee with 5 candle-power lamps for stair lighting on the same terms as gas-lighting is at present supplied, namely, 20*s.* per lamp.

THE Sheffield Town Council have rejected the recommendation of the special committee as to electric supply, that Sir William Preece be retained at a fee not exceeding 100 guineas to advise the committee as to the desirability or otherwise of combining the Corporation stations for the production of electric energy, whether for lighting, power, or for tramway traction, and also as to utilising the waste steam produced at the refuse destructors for the generating

of electric power. It was contended that the fee would be money thrown away, that the idea of combining the stations was impracticable, that the matter had not been adequately discussed by the committee, and that the local officials were quite competent to advise.

THE Chairman of the Newcastle Electric Supply Company announced at their recent annual meeting that the chemical company will shortly commence to lay down electrical chemical works at Carville, Wallsend, and will take from the company 13,000,000 units of energy a year, working night and day, Sundays and week-days. This and another company are expected to consume as many units as the whole present output of the company—30,000,000. They would have to hold at the disposal of the chemical company a certain amount of plant, including horse-power. The Supply Company would receive payment per horse-power per annum, whether it was used or not. If it was not used the Supply Company would get the advantage, but doubtless the chemical company would use it for as many hours a day as they possibly could. They would inaugurate a new era in electrical supply, like that which was in operation at the Niagara Falls. In order to do that they needed more plant.

VARIETIES.

A HANDSOME pavilion is to be erected on Weymouth pier. The estimated cost is 12,500*l.*

MESSRS. BRINDLEY & FOSTER have just erected a large three-manual organ in Woodford Green Union church, comprising entirely new tone scales and voicing.

THE health committee of the Birmingham City Council recommend that the number of female health visitors be increased from fifteen to nineteen.

THE Chelsea Borough Council has accepted a tender amounting to 21,090*l.* 12*s.* 6*d.* for extensions to the town hall, and application is to be made to the London County Council for a loan to cover the cost of the undertaking.

MR. JOHN SHAW, ex-president of the Surveyors' Institution, died at Derby on March 17, aged eighty-one. Mr. Shaw was well known in Derbyshire and Staffordshire as a land agent.

THE United Builders Labourers' Union state in their report for March that the Home Office has invited an expression of their opinion on the question of building trade inspection.

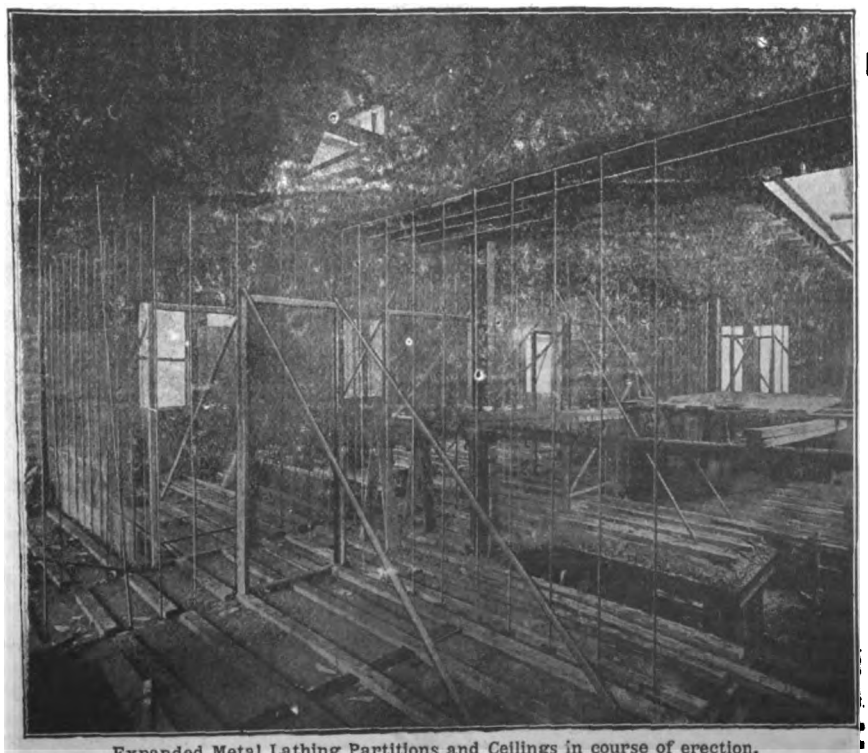
MR. CHARLES OWER is the architect for the new Scottish garden city, which will be situated on the outskirts of Dundee. Sixty cottages are to be first erected, all semi-detached, and it is intended later on to erect a number of larger cottages on the site.

THE March report of the Amalgamated Society of Carpenters and Joiners states that the membership of the organisation is now 68,369. Of these 5,396 were on unemployed benefit when the month opened, as compared with 5,622 in February.

A NEW Manchester general post office is to be erected on a site recently purchased in Newton Street, Piccadilly, now occupied by Houldsworth's mills. The accommodation of the present central office in Spring Gardens is inadequate.

MESSRS. W. CRUMBLEHULME & SONS, LTD., Derby Iron Works, Bolton, who said they had spent 200*l.* on smoke-consuming apparatus, were fined 20*s.* and costs at Bolton on Monday for emitting black smoke from the chimney of their works

MESSRS. R. E. W. BERRINGTON & SON, consulting and civil engineers, of Wolverhampton and 28 Victoria Street, Westminster, have taken into partnership Mr. Alick G. Martin, and the firm will in future be carried on under the name of Berrington, Son & Martin.



THE Board of Trade has sanctioned the erection of a pier 7,000 feet in length at Minster-on-Sea, Isle of Sheppey. This will be the longest pier in England. The Palace Pier, Brighton, is 1,760 feet in length, the West Pier, Brighton, 1,150 feet, Hastings Pier over 900 feet, and Eastbourne Pier 1,000 feet.

THE Scarborough Corporation have given Mr. E. T. Beard, M.I.C.E., their Marine Drive engineer, a testimonial with their Corporate seal affixed, and have also voted him 700*l.* in connection with various works additional to the new Marine Drive sea-wall, which he completed for them, after seven years' work, a year sooner than expected.

St. Stephen's Church, Newton Row, Birmingham, which was erected in 1844, is in need of immediate rebuilding. The building is of sandstone and was declared dangerous in 1891. Plans for a new church prepared by Mr. Bidlake have been adopted. The west front is to be preserved. The cost is estimated at 8,000*l.*

The Stockholm correspondent of the *Morning Post* states that "a Swedish-Norwegian Granite Trust has been formed for the purpose of exporting paving stones to England. British importers have profited up to the present by the sharp competition between the Swedish and Norwegian exporters."

The Edinburgh Town Council have been recommended to continue the present scale of allowances for travelling and personal expenses when engaged on Corporation business. A member is allowed first-class actual travelling expenses, and in the case of London two guineas a day for personal expenses. The committee suggest that on the days of departure and returning the rate should be one guinea.

The King is to be invited to open the new deep sea dock which has been completed at Cardiff at a cost of 2,500,000*l.* The work has occupied seven years, and about 1,500 workmen have been employed upon it. Its total area is 34 acres. It is nearly half a mile in length by 1,000 feet in width, and it has been made entirely of land reclaimed from the sea. The depth of the dock is 50 feet, and it will accommodate the largest vessels afloat.

At a special meeting of the Warrington Town Council on the 19th inst. it was decided that resolutions accepting architects' plans and builders' tender for the erection of a new school be rescinded. It was stated that plans were invited and the condition laid down that the cost of erection should not exceed 10*l.* 10*s.* per head of scholars accommodated, while the tender accepted amounted to 15*l.* per head.

The committee of the Greenwich Borough Council who are investigating the underground passages existing in the borough continued their explorations in Greenwich Park on Saturday. A number of large subterranean chambers were discovered. These communicate with one another by narrow passages, and have evidently been water reservoirs. Sanction has been given for the making of excavations in Greenwich Park with the view of seeking for further Roman remains.

The Glamorgan County Council have instructed the finance committee to raise the necessary sum, up to 150,000*l.*, by loans for general road widening and improvement, and that the sum found necessary be not raised out of the current rate. It is proposed to widen all narrow roads to a uniform width of 30 feet. An expenditure during the year of 65,834*l.* by the roads and bridges committee is sanctioned.

Messrs. Vickers, Sons & Maxim have come to terms with the Furness Railway Company for the widening of the entrance to the Buccleuch Dock from 80 feet to 100 feet. The cost will be very heavy, but the work is essential as a means of enabling Messrs. Vickers to undertake the building of the larger class of vessels. The Barrow firm have completed a slipway on which a vessel 1,000 feet long can be built, and they are considerably extending their fitting up berths, and putting down new electric cranes capable of lifting 150 tons.

The Metropolitan Water Board held a meeting on the 16th inst. An estimate of expenditure on capital account for 1906-7, which had been approved by the works and stores committee, was presented, and showed that the total estimated expenditure was 879,935*l.* Of this 5,000*l.* was required for Lee Valley new works, 234,411*l.* for reservoirs and aqueducts, 15,550*l.* for wells, 64,850*l.* for filter beds, 98,305*l.* for machinery, 103,805*l.* for buildings, 6,441*l.* for fencing, 325,623*l.* for extension of mains and pipes, 10,950*l.* for meters and fittings, and 15,000*l.* for contingency provisions.

The Birmingham water committee have announced their intention of increasing the charges for services or connections between the mains and the premises of consumers. It appears that the price hitherto charged was less than the cost to the department. For the first service, within a radius of two miles of the Council House, 50*s.* will be charged for a ½-inch pipe, 60*s.* for a ¾-inch pipe, and 70*s.* for an inch pipe, the old charges being 38*s.*, 43*s.* and 56*s.* respectively. After the first service 45*s.*, 55*s.* and 65*s.* will be charged, against 33*s.*, 38*s.* and 51*s.* hitherto. For distances exceeding four miles the charges for laying a first

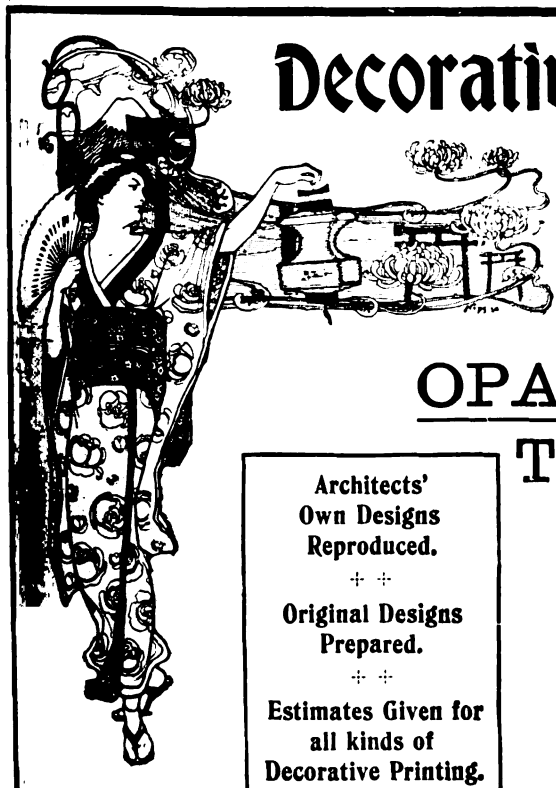
service will be increased from 2*s.* 6*d.* to 5*s.* The new scale takes effect on April 1.

MESSRS. S. PEARSON & SON, LTD., Westminster, have been awarded the contract for construction of a joint dock at Hull for the North-Eastern and Hull and Barnsley joint committee. It is anticipated that the new dock will be completed in about four years' time. The principal works comprised in the contract are:—A 38-acre dock, which is designed so that in the future additions can be made without interfering with the traffic, and the dock ultimately enlarged to about 80 acres; and a lock 750 feet long, 85 feet wide, with a depth on the sill of 19½ feet at low-water spring tides. The construction of the dock will be under the direction of the engineers of the respective companies, viz. Mr. T. M. Newell, C.E., for the North-Eastern Company, and Mr. R. Pawley, C.E., for the Hull and Barnsley Company. The cost will be probably 850,000*l.*

THE recent report of the Auditor-general on the Civil Service and Revenue accounts of the year 1904-5 contains some curious items. Almost 4,000*l.* has now been expended on installing the electric light at Windsor Castle. Laying down indiarubber under the arches of the main entrances to Buckingham Palace so as to obviate the noise of vehicles driving through cost 345*l.* At Hampton Court Palace 648*l.* was expended on altering and enlarging the famous vinery. Altogether 33,450*l.* less than Parliament voted was spent on the royal palaces, the total outlay being 58,949*l.* The outlay on the Houses of Parliament was 48,004*l.*, of which warming, ventilating and lighting absorbed just one-half. The sum paid by the London United Tramways Company as compensation because the electric tramways endangered the utility of the Royal Society's scientific investigations at Kew Gardens was 10,000*l.*, and that amount will meet two-thirds of the cost of erecting a new observatory at Eskdale Muir.



MR. THOS. BARRASFORD, the lessee of the Lyceum and a large circle of music-halls in the provinces, is arranging to give a series of performances in each of his halls in aid of those dependent on the men who have been killed in the recent mine disaster in France. The first performance will be given at the Paris Alhambra, Mr. Barrasford's continental hall, during next week, and is intended to relieve the immediate wants of the wives and families. He is appealing for the names of ladies and gentlemen who would be willing to act on a committee to deal centrally with the arrangements and general administration of the fund. The towns in which concerts are to be arranged are Brighton, Hippodrome; Tivoli, Leeds; Palace, Glasgow; Hippodrome, Liverpool; Hippodrome, Birmingham; Empire, Bristol; Pavilion, Newcastle; Lyceum, London; Alhambra, Paris; Britannia, Hoxton; Lyric, Liverpool; Hippodrome, St. Helens. It will be seen, therefore, that people in all parts of England will be given an opportunity of showing a real *entente cordiale* feeling.

NEW CATALOGUE.

THE Phœnix Engineering Company, Limited, of Chard, have arranged their business mainly to meet the requirements of contractors. They manufacture a variety of tar, pitch and bitumen boilers, tar pails, cauldrons, asphalting tools, rollers, lanterns, firemen's buckets, and, in fact, whatever is required in surfacing roads. They have also specialties in sweeping machines, road scrapers, &c. Another section relates to tools employed in work on drains; street watering and sewer flushing are likewise provided for. Then there are several pumps which are adapted for the roughest usage. Crab winches, cranes, tip-waggons, iron tank and plate-work, manhole covers, are also produced. Finally, a satisfactory builders and contractors' cottage can be supplied for the small sum of 10*l.* 5*s.* The catalogue is well worth the attention not only of contractors, but of local authorities who wish to produce satisfactory work with economy.

W. SUMMERSCALES & SONS, LTD.

AN example of the kindly feeling which should prevail between employers and employed was afforded on the 13th inst., when about 700 of the workmen and their families employed by Messrs. Summerscales & Sons, Ltd., were entertained in order to commemorate the coming of age of Mr. Serlo Longsdon, the son of Mr. H. C. Longsdon, the

chairman of the company. Mr. Longsdon, who presided, said that it was twenty-one years since he became associated with the firm. He maintained that if capital and labour would link hand-in-hand and work and fight together then they would have a great result—a great success for the man and for the country of which they were proud. He would like to lay emphasis on that point because he thought they wanted to realise more the responsibility of each for the other. He thought he was right in saying that the firm of W. Summerscales & Sons, Ltd., had worked amicably, peacefully and pleasantly for the twenty-one years that he had been connected with them.

Mr. Robson, as the representative of the employés, presented Mr. Serlo Longsdon with a gold hunter watch and letter as an expression of their regard in his coming amongst them, and also their congratulations on gaining his majority, and also to express their best wishes in his future career for happiness, success and prosperity.

Mr. Serlo Longsdon, in briefly responding, said he took the present as being a tribute to the family generally rather than to himself.

Mr. H. C. Longsdon said his wife and he were proud of the way in which their son had been honoured that night.

YORK MINSTER RESTORATION.

The progress of the work at York Minster during the winter has been somewhat retarded by the broken weather, but with the improved weather, says the *Yorkshire Herald*, it will be pushed on more rapidly. Two of the flying buttresses have been completed on the north side, and the erection of scaffolding for two more has been commenced. When the timber has been removed from the two completed pinnacles and arched buttresses there is every indication that they will be found to have added immensely to the effectiveness, dignity and architectural completeness of the elevation.

The work of restoring the flying buttresses on the south side of the nave wall has also been commenced, and some progress has been made. On this side the pinnacles in continuation of the main buttresses have been in existence since the minster was built, and attached to them are portions of the original flying buttresses. These old weather-worn stones, which formed the initial work of the flying buttresses, have been carefully removed and replaced by fresh work. It is hoped that by the time of the visit of the British Association the flying buttresses will have been completed on both sides and the scaffolding removed from the western front, on which a vast amount of absolutely necessary work has been done during the past two or three years.

BIRMINGHAM BUILDERS' EXCHANGE.

An address on "Canadian Cities" was delivered before the members of the Birmingham Builders' Exchange, by Mr. Peter Ball, the resident agent in Birmingham for the Commercial Agency of the Government of Canada.

Lieutenant-Colonel Barnsley, in opening the proceedings, said the committee had acted wisely in introducing into their series of lectures an address by such a practical man as Mr. Ball upon one of the greatest, most vigorous and enterprising of our colonies. We had heard a great deal lately of the importance of the colonies in relation to the Mother-country, and, quite apart from questions of party politics, all would agree that it was desirable we should know as much as possible about our colonial possessions.

Mr. Peter Ball in the course of his address traced the history of Canada from the time of the capture of Quebec from the French by General Wolfe in 1759, and referred to the territorial acquisitions by the British Government in North America at that and subsequent periods. He explained the origin of the Constitutional Government under which Canada was ruled, and at some length alluded to the confederation of the different provinces in 1867, describing the duties of the Central Parliament as well as those of the provincial legislatures. With regard to education, a subject attracting considerable attention in England at the present time, he said that the law separating the Church from the State was passed in 1841, and under it the lands were taken from the different churches and appropriated to school purposes. At the same time, however, an endeavour was made to avoid doing injustice, and any clergyman or other person who had benefited from the Church lands was permitted to continue to derive that benefit until his death.

Then turning to the Canadian cities and municipalities, he took Toronto, the second city in the country, as typical of the whole. He gave the area of the city, the population, the number of streets and described the tramway system. The city owned the streets and the authorities conceded the tramway rights to a company for twenty-one years, when they could be purchased by the municipality. The company paid the city 160*l.* per annum per mile for the right to run the trams, and in addition a percentage of the gross receipts. Up to 200,000*l.*, the company paid 8 per cent., from 200,000*l.* to 300,000*l.* 10 per cent., from 300,000*l.* to 400,000*l.* 12 per cent., from 400,000*l.* to 600,000*l.* 15 per cent., and from 600,000*l.* upwards 20 per cent. In 1895, when that arrangement was entered into, the city drew in percentage and mileage upwards of 27,000*l.*, and in 1904 more than 64,000*l.*; while in the nine years the amount received was 360,000*l.* The cost of living, the cost of schools and other things was much less than in this country, the rents of houses were pretty much the same, the water rates were lower and the gas charges were a little higher, but the light and heating qualities were very much better.

The lecture was enhanced by the lantern illustrations which were selected to give as good an idea as possible of the buildings of the cities.

BIRMINGHAM ARTWORK.

THE members of the Birmingham Midland Arts Club are very anxious that the work of the Birmingham artists and craftsmen shall be more fully represented in the permanent collection of the Art Gallery. Attention was directed to the subject at their annual meeting recently, and, according to the *Birmingham Daily Post*, a deputation was appointed to represent their views to the art gallery committee. On Monday last the deputation waited upon the committee, which met at the Council House under the presidency of Alderman the Right Hon. William Kenrick. The deputation consisted of Councillor Tonks, Messrs. R. K. Dent (president of the club), W. J. Wainwright, R.W.S., W. J. Cross (hon. treasurer), and G. L. Leigh (hon. secretary). Councillor Tonks introduced the deputation, whose spokesmen were Mr. Dent and Mr. Wainwright.

It was urged that a definite section for local art should be formed, under the supervision of a sub-committee (appointed by the museum and school of art committee) of gentlemen having special knowledge of local art, who would report from time to time upon such specimens as might be obtainable. With a view to arousing interest in such proposal the deputation suggested that it might be desirable to form a loan exhibition of local arts, either as soon as arrangements could be made or when the new galleries were ready—possibly as a special feature of the opening. For that purpose collectors should be invited to place their collections at the disposal of the committee, who would select examples and so avoid overlapping. The deputation pointed out that by "local art" they did not mean exclusively the work of painters, engravers and etchers, but also sculpture, metalwork—embracing the work of the goldsmith and silversmith, jewellery, ironwork, locksmith's work, &c.—as well as fine examples of the work of local medallists and die-sinkers and applied arts generally. They also desired it to be understood that they did not advocate the acquisition of specimens merely on the ground of their local origin, but that each should be worthy of the artist or craftsman as well as of the gallery.

The committee listened attentively to the views of the deputation, and in reply Alderman Kenrick stated that there was already in the gallery a considerable collection of examples of local art. There were pictures by a number of local artists, irrespective of the "graphic illustrations of Warwickshire" by local engravers. They had also various specimens of Birmingham artwork, including those purchased on the occasion of the Bingley Hall exhibition on the occasion of the visit of the British Association. The Birmingham medallists of the old Soho Mint, Thomason and Joseph Moore, were well represented, and one of the last acts of the committee was to spend a certain sum of money in the purchase from Mr. Thomas Spall of a collection of fine old cut steel ornaments. Mr. Spall was formerly associated with the firm of Elkington & Co., and was a member of the Midland Arts Club. The committee were in possession of many treasures which could not be properly exhibited in the present circumscribed building, but which it was hoped to show to the best advantage in the new gallery. It must be remembered, too, that the committee

had no money to spare. They were dependent upon gifts, and practically a large proportion of the exhibits had been presented to the gallery. If, said Alderman Kenrick, the club could influence the gift of good work—work which would be acceptable to any gallery, because it was worthy of exhibition—it would be very welcome to the committee.

Mr. Whitworth Wallis would be glad to inspect any objects which might be offered, and to report to the committee.

The deputation were satisfied with their reception by the committee, and they regarded the interview as favourable. They will present a report to the next meeting of the club.

PIER EXTENSION AT SOUTHSEA.

SOUTHSEA will have every reason to be very proud of its piers when the extension to the Clarence Esplanade Pier has been carried out and the South Parade Pier has been reconstructed. What the new pier will be, says the *Portsmouth Evening News*, seems at present a matter of uncertainty, but that the Clarence Pier will be a very fine structure cannot be gainsaid. All that is required, indeed, to make the pier one of the finest along the south coast is additional promenade accommodation, and the fulfilment of this need is among the objects the directors have in view in the work of extension that has just been entered upon.

The pier is to be enlarged on the harbour side, and this will place at the disposal of visitors an extra deck space of something like 30,000 superficial feet. The north-west side of the pier is to be carried out another 250 feet, which will have the effect of giving a frontage accommodation for at least two more boats than at present. Four extra landing-places are to be provided, each with three levels, which will prove an immense advantage during the crush of the excursion traffic, and the new portion will increase the total length of the pier to no less than 550 feet.

The whole of the work except on the actual sea line will be constructed on piles of the new ferro-concrete, the beams and joists being of the same material. Each of the huge piles has an interior of interlacing ironwork woven on a framework of heavy steel rods. These are then placed in a long trough-like mould and the concrete is worked amongst the iron until the mould is full. Several weeks are necessary to thoroughly dry the concrete, and then the huge piles are said to be practically everlasting, as age only tends to harden them still more. Of course great care is necessitated in driving in the piles, and a special arrange- is devised in order to minimise the jar of the impact of the "monkey." The ferro-concrete process was only introduced a few years ago, but is now being used in all new sea structures. The bracing will also be of ferro-concrete, to which the decking will be secured. Massive greenheart piles will form the front of the structure in order to take the rub and jar of the calling steamers.

Already the work, which is to cost between 10,000*l.* and 11,000*l.*, is well in hand. A very large temporary staging has been constructed for the purpose of driving in the huge piles, in which work three or four steam pile-driving engines will be engaged. In about a fortnight the actual driving of the piles will be commenced. The contractors for the work are Messrs. Robert H. Neal, Ltd., of Plymouth, whose manager, Mr. H. G. Newmarsh, C.E., is personally superintending the work. Mr. Henry Lawrence is the clerk of works. The time allowed for the completion of the contract is eight months, but it is believed that the task will extend beyond that period. When the work is finished the band-stand will be removed to the edge of the new portion, so as to provide more space for passengers and others leaving the pier.

BUILDING IN GREENOCK.

THE following warrant of authority to erect four blocks of dwelling-houses and shops has been granted to Messrs. Robert M'Alpine & Co., builders, of Glasgow:—

The Dean of Guild having resumed consideration of the process and having heard agents in the case, and having consulted with his brethren in Council, finds that the petitioners propose to erect blocks of dwelling-houses along Port Glasgow Road, and along a private street forming a continuation in crescent form of Chalmers Street, Greenock. Said private street will be at its entrance from Port Glasgow Road 50 feet in width, and its continuation with Chalmers Street about 40 feet, but the dwelling-houses in said streets are planned so as to show a width varying from 60 feet to

70 feet between buildings, and the ground in front of buildings, exclusive of the width of street before mentioned, is shown to be utilised for shrubberies; finds that the exterior walls of the buildings are not solid, but are constructed as hollow walls; finds that the party walls between tenements are shown as 4½ inches thick, but that Section 289 of the Greenock Police Act, 1877, permits of this thickness; finds that the height of the apartments are in accordance with the Greenock local Acts; therefore repels the objections stated on behalf of the Master of Works of Greenock, and grants warrant to the petitioners to erect their buildings as craved, but ordains that the thickness of exterior walls of the first storey shall be 22 inches including cavity (9 inches outside, 4 inches cavity and 9 inches inner wall). The walls of the upper storeys to be 18 inches, as shown on the plans (9 inches outside, 4 inches cavity and 4½ inches inside), all the exterior walls to be rought-cast with slag and cement. And ordains the petitioners to adjust with the Master of Works details regarding strength of balconies, lintels, beams, scantlings of timber, asphalte roof and method of bonding hollow walls, and to furnish him with detailed sections of the work where required, and otherwise ordains that the whole work shall be carried out in accordance with the local Acts and by-laws of the Court, and the petitioners' plans are docquetted and subscribed as relative hereto.

THE WIDNES AND RUNCORN TRANSPORTER BRIDGE.

AT the ordinary meeting of the Institution of Civil Engineers on Tuesday, March 13, at 8 P.M., Sir Alexander R. Binnie, president, in the chair, the paper read was "The Widnes and Runcorn Transporter Bridge," by J. J. Webster, M.Inst.C.E. The following is an abstract of the paper:—

As the only convenience for vehicular traffic between the Lancashire and Cheshire sides of the river Mersey was by means of the cumbersome ferries at Liverpool, or by the bridge at Warrington, considerable inconvenience was experienced by manufacturers, farmers and others on both sides of the river; and in 1817 Telford was asked to design a suitable scheme for crossing the river at Runcorn. He proposed a suspension bridge of 1,000 feet span, having a 30-feet roadway, but the scheme was never carried out. Several other schemes for bridges and tunnels have since been proposed, but in each case the cost has prevented the scheme from being proceeded with.

Application was made to Parliament for powers to construct a transporter bridge between Widnes and Runcorn, and after much opposition the Act was obtained in July 1900; a company was formed, strongly supported financially by the Corporations of both Widnes and Runcorn, and the contract for the work was let in November 1901. The principle of the transporter bridge was designed by Mr. Charles Smith, of Hartlepool, who, in 1873, planned one to cross the river Tees at Middlesbrough. This was not constructed, but similar bridges have been erected at Bizerta, Portugalete, Rouen and Rochefort, and one on this principle is now being erected at Newport, Mon.

The Widnes and Runcorn bridge crosses the river Mersey and the Manchester Ship Canal with one span of 1,000 feet, and approach viaducts, 35 feet wide, on both sides of the river. The bridge is similar in construction to an ordinary cable stiffened suspension bridge, but instead of the costly high-level approaches, the traffic is carried across by means of a car suspended from a trolley running on the underside of the stiffening girders and driven electrically.

The cables are supported by two towers on each side of the river, the towers being square in plan, with braced legs at each corner having a curved profile; the width at the bottom is 35 feet and at the top 9 feet, the height from high-water line to the centre of the cables being about 175 feet. Each pair of towers is braced together with two double-braced curved girders at the top, and at the level of the top of the stiffening-girder. The towers rest upon four cast-iron cylinders, 9 feet in diameter, which are founded on the rock. There is one cable from tower to tower, each cable carrying a stiffening-girder, 19 feet deep, hinged at the centre. Each cable has an area of 50 square inches, made up of nineteen strands laid parallel and clamped together; the steel wires—0.162 inch in diameter—having a breaking strength of 95 tons per square inch. The cables are attached to forged steel cross-heads, to which are coupled

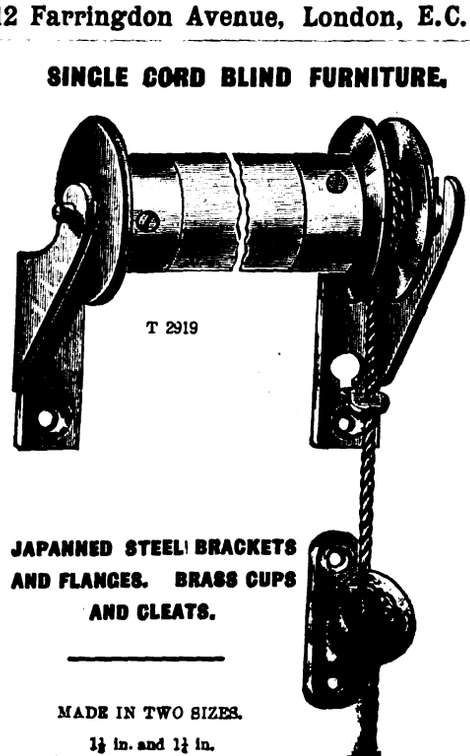
the steel links taken down to anchor-plates in pits excavated in the rock and filled in with concrete. The suspenders from the cables to the stiffening-girders are steel wire ropes 1¾ inch in diameter, spaced 18 feet apart, and are coupled to bridles attached to the cast-iron clips of the cables. The cables are coated with a bituminous compound and wrapped with two layers of strong sailcloth saturated with the same solution. A number of experiments were made with different forms of steel ropes and connections, details of which are given in the paper. Some interesting experiments were also made with steel pins, the results of which show that in designing pins for bridgework, although they would fail by shear, they should be designed to withstand the bending-moments.

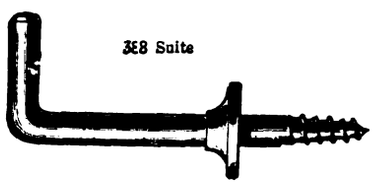
The car-trolley, which runs on rails on the bottom flange of the stiffening girder, is 79 feet long, articulated in five sections, and 4 feet 10 inches deep. There are bogie wheels on each side 18 inches in diameter. The motive-power consists of two electric motors of 36 brake horse-power, each driving, through gearing, one pair of wheels. The trolley is fitted with electric and hand brakes, the whole of the machinery being under the control of the man in the cabin at the top of the car. The car is 55 feet long and 24 feet wide, and travels at a speed of seven miles per hour. The generating machinery is contained in a building at the bottom of one of the Widnes towers, and consists of two gas-engines of 75 horse-power each (one being spare), two dynamos of 48 kilowatts capacity (one being spare), one booster and an accumulator with a battery of 245 cells. The machinery supplies the necessary current for driving the car and illuminating the structure, and was designed in consultation with Dr. Edward Hopkinson.

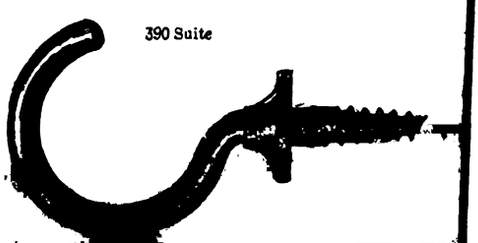
The total cost of the structure, including the cost of obtaining the Act, was about 130,000*l.*

The engineers for the work were the author and Mr. John T. Wood, M.Inst.C.E., the resident engineer being Mr. L. H. Chase, M.Inst.C.E. The contractors for the masonry, &c., were Messrs. W. Thornton & Sons, Liverpool; the contractors for the superstructure were Messrs. Arrol's Bridge and Roof Company, the cables being constructed and erected by the St. Helens Cable Company. The electric machinery was constructed and erected by Messrs. Mather & Platt, of Manchester.



TUNBRIDGE WELLS.





This favourite and well-known resort, which may be considered of historical interest, with its famous Pantiles and chalybeate springs, its Mount Ephraim, Mount Pleasant and Mount Sion and its health inspiring common, besides various other attractions, is noted, from an industrial point of view, principally for the Tunbridge ware which is said to have been introduced there in imitation of the inlaid woodwork for which Spa, in Belgium, was celebrated. Great strides have, however, been made in recent years, and what with its fine Opera House and its admirably equipped Technical Institute that was built from the designs of Mr. H. T. Hare at a cost of about 20,000*l.* to provide technical, scientific and general education, as well as a school of art for the inhabitants of the district, the Tunbridge Wells of to-day is a very different place from what it was at the period when, as shown by a well-known print, it became the resort of among others Dr. Johnson, Garrick, Beau Nash, Colley Cibber and Mrs. Thrale, as portrayed in the pages of Thackeray.

During a recent visit there we were enabled to inspect the Holly Bank Joinery Works, owned by Messrs. Strange & Sons, of Tunbridge Wells, and established many years ago. In the spacious and well-arranged workshops, which are equipped with ample machinery of the most modern type, large quantities of joinery of all kinds are turned out, and a specialty is made of mantle-pieces, creditable specimens whereof both in oak and walnut were brought under our notice. Other manufactures embrace dadoes, church seating, choir stalls, bank and office fittings, staircases, domes, &c., and a large stock of well-seasoned teak, Kauri pine, wainscot, and other hard as well as soft woods is kept on the premises in specially constructed sheds.

There is also a masonry department adjoining supplied with stone from the firm's quarries at Stonewall, Langton Green, near Tunbridge Wells. The material is a warm buff sandstone of fine texture and grain, with excellent weathering qualities, which has been extensively used for the erection of public as well as private buildings in the neighbourhood.

HALL'S SANITARY WASHABLE DISTEMPER

The Refinement of Good Taste in Wall Decoration

is shewn in the choice of Hall's Sanitary Washable Distemper. This is a wall covering that is at once artistic, practical, and economical.

Its practical advantages are simplicity, durability, and cheapness. Only water is required to be added to make Hall's Distemper ready for use. It is unaffected by light, heat, or damp, does not crack or peel off, and is washable.

It is made in 73 colours, including rich dark as well as light shades; in actual cost it is cheaper than wall paper or flatted paint, and being applied with a whitewash brush represents a further great saving in labour.

"Sisco" White Japan is the correct material for painting Doors, Picture Rails, and all woodwork of rooms decorated with Hall's Distemper. "Sisco" Japan is a pure white decorator's enamel, which dries with a hard, smooth, lustrous surface. It lasts for many years with beauty unimpaired.

"Modern Development in House Decoration," a beautiful booklet with coloured views of Drawing, Dining, Bedroom, and Library, sent post free on application (with samples and shade-card of Hall's Distemper if specially requested), from the sole manufacturers,

HALL'S Sanitary Washable DISTEMPER

The Real Sanitary Water Paint.

Hall's Distemper is the real Washable Distemper. It was one of the first invented, and is to-day better than ever, because the Manufacturers have, by reason of many years of scientific and practical tests, continually improved its manufacture until perfection has been attained.

Hall's Distemper is made in two qualities—the inside quality is specially for interior wall decoration, the outside quality being most suitable for all other purposes, both inside and out, whether on wood, stone, brickwork, or any kind of building material.

Its utility for Farm and Estate Buildings, such as dairy and tool-sheds, kennels, barns, shooting boxes, and temporary buildings of all sorts, is remarkable.

Full particulars of Hall's Distemper, in the form of a beautiful booklet, entitled "Modern Development in House Decoration," will be sent post free on application to the Sole Proprietors and Manufacturers,
SISSONS BROS. & Co., Ltd., HULL.

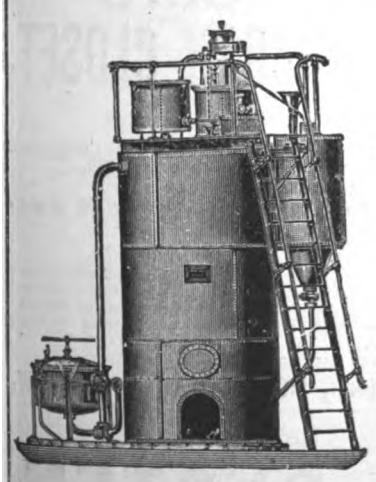
BENT STEEL SAFES AND STEEL DOORS
to meet all risks. Established 1850.



We have recently supplied our Safes to the following Corporations: Belfast, Blackburn, Bournemouth, Burnley, Chelsea, Kendal, Manchester, Newport (I.W.), Norwich, Omagh, Pudsey, Wolverhampton, &c.; and they are in use in most of the Post Offices and County Courts throughout the United Kingdom.

SKIDMORE'S SAFES have never failed to preserve their contents from the ravages of the fiercest flames.

Send for our Illustrated Catalogue and compare specifications and prices.

We are just now placing in the NEW CITY HALL, BELFAST, six large Safes of our manufacture, the contract for which we obtained in competition with all other first-class makers.

AWARDED SILVER MEDAL, SANITARY INSTITUTE, 1902.

THE BRITISH SANITARY CO.'S NEW AND IMPROVED SELF-ACTING EARTH CLOSET.

HIGHEST AWARDS:

Birkenhead, 1881; Newcastle-on-Tyne, 1882; Glasgow, 1883; Dublin, 1884; Plymouth, 1885; Edinburgh, 1886; Glasgow, 1887; Haddington, 1892; Liverpool, 1894; Newcastle-on-Tyne, 1896.

For Simplicity and Efficiency their Closet stands alone.

Medal from the Society of Architects, London, for superiority of workmanship and materials used in manufacture of Closets.

ITS ADVANTAGES ARE:—

1ST. The simplicity, strength of the mechanism, and non-liability to get out of order. 2ND. It is self-acting. 3RD. The effective distribution of the deodorising material thoroughly covers and absorbs all offensive matter and smells. 4TH. The large capacity of the containing magazine holding the earth or other deodorising material. 5TH. The very moderate price it can be sold at as compared with other closets not even possessing the above advantages.

PRICE LIST AND FULL PARTICULARS SENT ON APPLICATION TO

GOOD ADVICE.

Architects, Contractors, and others are recommended to journey by the

GREAT CENTRAL RAILWAY.

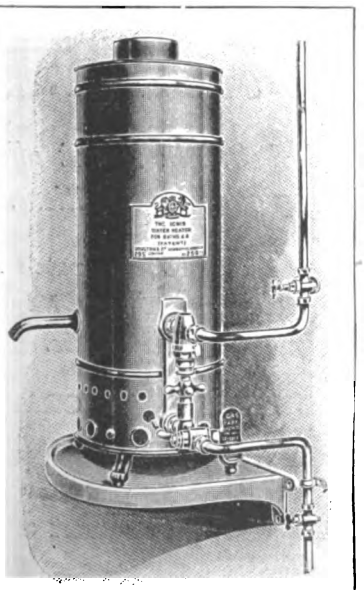
They will find it

RAPID TRAVEL IN LUXURY.

Each Express is VESTIBULED and has a BUFFET CAR attached available for FIRST and THIRD-CLASS PASSENGERS.

The London Express Trains centre on Sheffield, branching therefrom westward to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool; northward to Huddersfield, Halifax, Bradford, Leeds and York; eastward to Doncaster, Grimsby, Hull and North Lincolnshire.

Cross Country Expresses and Through Arrangements with other Companies are a distinct feature of the Great Central services. Liverpool, Manchester, and Sheffield are linked up by corridor trains with Lincoln, Harwich, Lowestoft, Norwich, and the Great Eastern system.



Newcastle, Sunderland, Durham, York, Bradford, Huddersfield, Rotherham and Sheffield are provided with through trains *via* Nottingham, Leicester, Banbury and Oxford, to and from Southampton, Bournemouth and the South-Western Line.

Bath, Bristol, Exeter, Torquay, Kingswear, Plymouth, and the Cornish Riviera are reached by Express Trains from Leeds, Wakefield, Halifax, Huddersfield, Sheffield, Nottingham, and Leicester.

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. off ordinary fares.

DOULTON'S "IGNIS" BATH HEATER

IN COPPER.

No. 1497.

Bath heaters are of the greatest benefit in a house even though there is a system of hot-water circulation. The use of gas for cooking, &c., through a great part of the year, saves the ordinary firing and thus stops the hot-water supply. In such cases a bath heater is most serviceable, as a hot bath can be had at any time, at a minimum cost and without any trouble.

To meet this special demand Messrs. Doulton have made a heater that is both cheap in price and lasting in wear.

All parts are made in stout hardened copper, tinned inside.

The water in no case comes into contact with the gas.

Ordinary burners are used for heating instead of Bunsen's or atmospheric.

Cold water is raised 55° in passing through the heater, but water of a higher temperature can be obtained if the quantity is reduced.

The flow of water should be regulated by a stop cock, so as to give the amount of water required and no more,

PRICES.

No. 1497. Polished copper heater to give 1½ gallons per minute £4 15 0
No. 1497A. Polished copper heater to give 2 gallons per minute 5 10 0

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

THE MOMENTUM ENGINE (Patented). The Discovery of Mechanically-made Power.
NOW IN OPERATION AT THE ALEXANDRA PALACE, LONDON, N.
THE discovery; that, a free racing Flywheel possesses two natures, under one—it will receive rotary motion for the application of twenty pounds—notwithstanding it weighs a ton, and the second nature of the Flywheel is, that when it is connected to a working load it will throw out the rotary value of the centres of the weights in motion, by the square of the velocity, the centre of Gyration.
This discovery means several great Flywheels, each separately driven by any motive power, each Flywheel taking its regular turn to revolve a working shaft, to which it is connected, and from which it is disconnected for a greater length of time. Radium, and also these Engines, prove that the Theory of Energy is false. This Engine can be seen running the electric light at the Alexandra Palace. It is explained free.
The Engine has taken a first-class Diploma of Merit at the Alexandra Palace for Electric Lighting.
Offices:—ALEXANDRA PALACE, LONDON, N. Proprietor:—B. C. POLE.

WREXHAM.—March 31.—For the erection of a chapel in Victoria Road. Mr. Ivor H. Jones, Johnstown, Ruabon.

BUILDERS AND WAR OFFICE.

THE report of the Comptroller and Auditor-General on the appropriation account of the Ordnance Factories states that in May 1900 Messrs. Kirk & Randall contracted to reconstruct certain "danger buildings" at Woolwich, the work to be paid for by measurement. Eventually a sum amounting to about 107,000*l.* was paid to them. The firm, however, made a claim that certain work necessary for the completion of the buildings which they were ready to execute and capable of performing was done by the Building Works Department or other contractors. They estimated the profit they would have made on the work so withheld at 6,150*l.*, and that this would have practically nullified their actual loss on the contract, which they placed at 6,696*l.* Correspondence followed. The War Office recommended that 900*l.* should be paid in settlement of the claim. The Treasury duly considered the case, and desired to know whether the Army Council thought that "any officers were to blame." The Army Council replied that the contract was entered into at a time of great pressure during the war, and it had "not been thought necessary to attribute blame to any officer." Thereupon the Treasury assented to the payment, noting that "funds are available for the purpose under sub-head E, Part I. (Buildings) of the Vote for Ordnance Factories."

THE municipality of Durban, Natal, are reported to have under consideration a scheme of improvements, including a pier, which it is estimated will cost 150,000*l.* The scheme will mean the reclamation of some 300 acres of land on the sea front, which will cost about 350,000*l.*

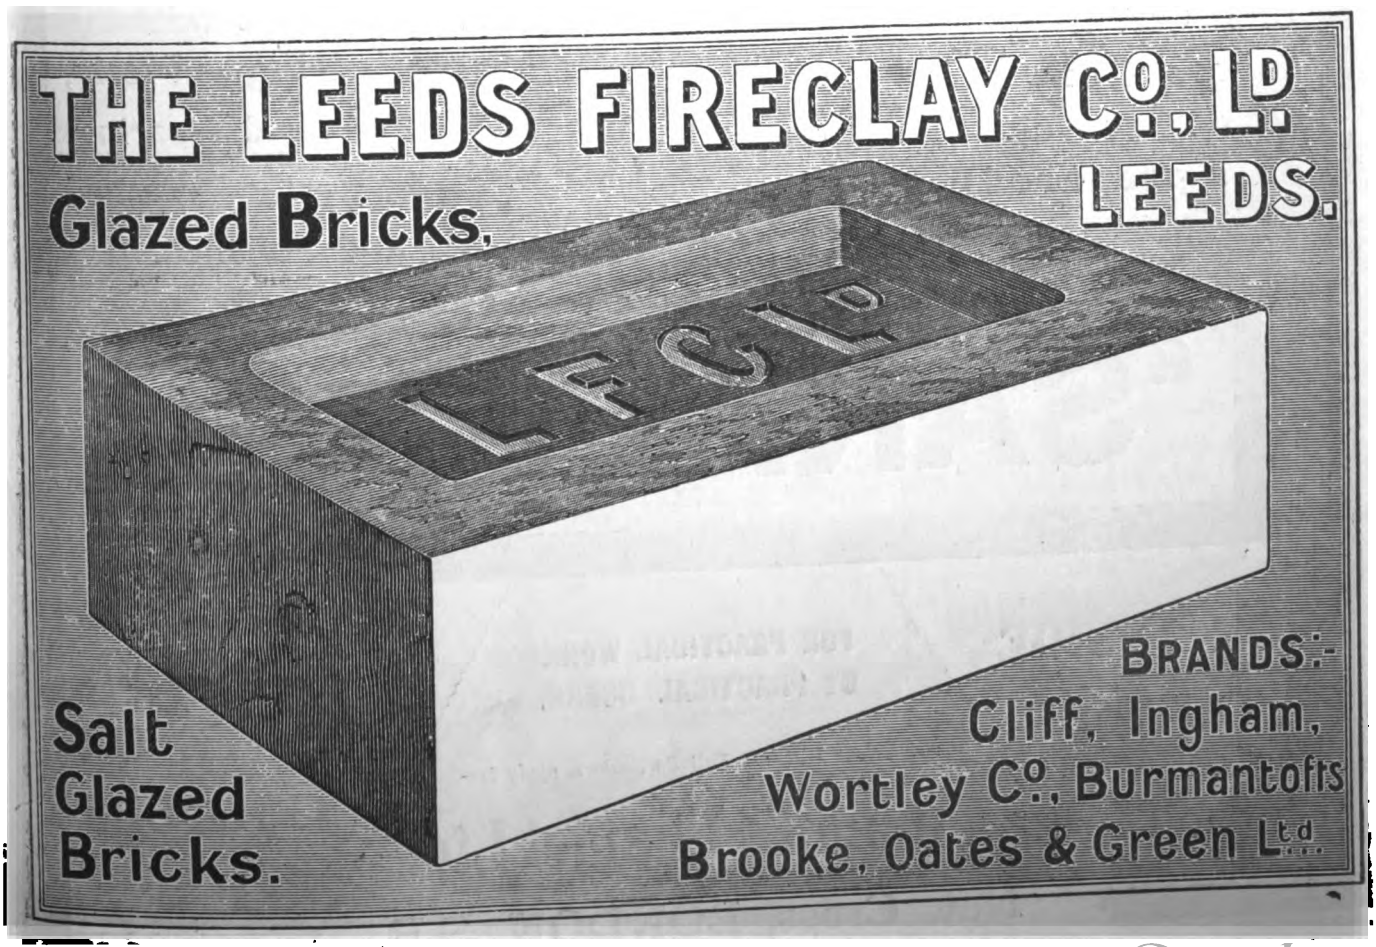
TRADE NOTES.

MESSRS. ROBERT BOYLE & SON have brought out a little brochure containing the opinions of several authorities relating to the ventilation of schools, and which is worth the attention of all having an interest in that class as well as other classes of buildings.



MESSRS. JOHNSON & PHILLIPS, LTD., have been elected members of the Cable Makers' Association, and their standard wires will in future bear the official labels authorised by that Association.

THE Patent Indented Steel Bar Company, Limited, has been formed for supplying a bar of special section for reinforced concrete construction. The features of the bar are great adhesion to the concrete owing to the mechanical bond formed by its indented surface, and a constant section, thus utilising the full sectional area in resistance to stresses. This bar has already been employed abroad on a considerable scale in concretework. The company's offices are situated at Queen Anne's Chambers, Westminster, S.W.

AT Boscombe, near Bournemouth, it is proposed to erect a new temperance hall at a cost of 2,000*l.*

THE Corporation of Manchester have decided to purchase, for the purpose of pulling down, St. Peter's Church at a cost of 20,000*l.* The site will then be for the use of the public.

THE new bridge over the London, Tilbury and Southend Railway line at Leigh, Essex, is to be commenced at once. The railway company have approved the plans.

Digitized by Google

ELECTRIC NOTES.

THE West Ham Corporation announce that after March 31 their electric supply will be reduced to an all-round rate of 3*d.* per unit, and that after June 30 the current for power purposes will be further reduced to an all-round rate of 1*d.* per unit. It is pointed out that the maximum power rate of 1*d.* per unit is 33⅓ per cent. less than the maximum rate mentioned in the London Powers Bill.

THE electric-lighting committee of Arbroath Town Council have agreed to recommend the Council to offer no opposition to an application to be made to Parliament by Mr. George Balfour's company for a provisional order for the electric lighting of Arbroath. The committee are to do everything in their power to assist Mr. Balfour's company to successfully carry out the undertaking.

THE *Indian Textile Journal* states that operations will be commenced by the Bombay Hydro-Electric Syndicate for the purpose of supplying the textile mills of Bombay and district and other users with electric current obtained by utilising the water in the Ghats, immense quantities of which are wasted during the monsoons. Pipe lines, giving a fall of 1,700 feet, are to be constructed to supply the power.

AN experiment is being conducted on land 19 acres in extent at Iron Cross, between Evesham and Alcester, electricity being used to promote the growth of farm crops. It has been found that electricity discharged into the air over some crops tends considerably to increase the yield, one cause suggested being that the discharge enables the plant to absorb nitrogen directly from the air. In the experiments at Iron Cross the electricity is discharged from overhead wires suspended 16 feet above the ground from poles 100 yards apart. The current is generated by a dynamo driven by a three horse-power oil-engine at the farm buildings, and is transformed to a high pressure and distributed over the wires, the current going to earth through the air, and consequently through the crop that is growing beneath the wires.

IT is probable, says the *Manchester Guardian*, that in the not distant future the firm of Vickers, Sons & Maxim, shipbuilders and engineers, of Sheffield and Barrow-in-Furness, will establish a branch of their great engineering industrial business in Manchester. At present it is too early to say that a particular scheme has been decided upon, but the idea is that works shall be taken in Manchester, not far from the Ship Canal, for the manufacture of electrical equipments and the development generally of an electrical engineering business, as a part of the business of the company. Messrs. Vickers, Sons & Maxim may make their entry into Manchester either by way of establishing entirely new works or by amalgamating with or absorbing a business of magnitude already established in excellently equipped premises. The second course is, granted that circumstances favour the undertaking, most likely to be followed.

VARIETIES.

THE Institute of Sanitary Engineers visit on the 31st inst. the Edmonton sewage farm, which is on the broad irrigation principle.

THE Metropolitan Asylums Board are considering the advisability of building large central stores. The estimated cost is 18,000*l.*

PLANS have been approved of a new Council school at Buxton that is to cost 4,562*l.* and to accommodate 400 boys. The site has cost 1,425*l.*

THE Stourbridge Board of Guardians expressed by a large majority their disapproval of the extravagance shown in a recommendation to purchase a "master" clock for the workhouse tower at a cost of 120*l.*

THE Governors of the Warrington infirmary and dispensary have unanimously resolved to extend the institution at a cost, including furnishing, of from 11,000*l.* to 12,000*l.* It is intended to erect a pavilion of three storeys, which will contain sixty-six beds, bringing the total accommodation up to 104. The plans also include a separate home for the nursing staff.

THE Kensington Borough Council has received a communication from the London County Council improvements committee refusing to proceed further with the scheme, estimated to cost 285,700*l.*, for widening Church and Silver Streets, because the Borough Council has declined to sanction the construction of a tramway in the thoroughfare when widened.

THE works committee of Holborn Borough Council have stated that they are not disposed to entertain any proposals for the erection of kiosks for the sale of newspapers, &c., upon the footways of Kingsway.

THE architect for what is really Paris in London, but which is now referred to as a block of shops and offices, a theatre, &c., to be erected on the vacant L.C.C. site, is, we are informed, Mr. W. Gilbee Scott, F.R.I.B.A., of 25 Bedford Row, London, W.C.

A LOCAL GOVERNMENT BOARD inquiry, over which Colonel A. C. Smith, R.E., will preside, will be held at the Council House, Birmingham, on Tuesday, concerning the application of the City Council for power to borrow about 28,000*l.* towards the purchase of Warley Park.

MR. JOHN WALKER, of Field House, Uttoxeter Old Road, Derby, builder and contractor, a prominent Freemason and a member of the Town Council, who died on January 10 last, aged 64 years, left estate valued at 35,650*l.* gross and 11,895*l.* net.

IN appreciation of the facilities accorded to the Sheffield Society of Engineers and Metallurgists by the Faculty of Applied Science of Sheffield University, the Council of that Society have contributed 100*l.* towards the purchase of a Brayshaw hardening furnace for use in the engineering and metallurgical departments of the university.

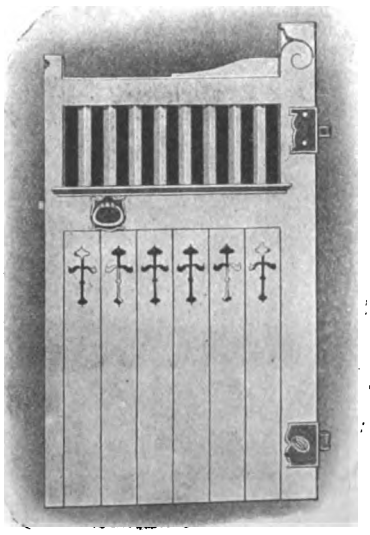
A DEPUTATION of about twenty-six members organised by the National Civic Federation of New York are visiting cities in America and Europe for the purpose of inquiring into the relation of municipal bodies to gas, water, electric light and tramway undertakings. The deputation arrives in this country in the beginning of June.

THE foundation-stone of premises to be used as motor warehouses at Nos. 132, 133, 134 and 135 Long Acre, W.C., was laid on Saturday, the 24th inst. The architect is Mr. W. Woodward, F.R.I.B.A., and the contractors Messrs. Patman & Fotheringham, Ltd., of Theobald's Road, W.C., and Park Street, Islington, N.

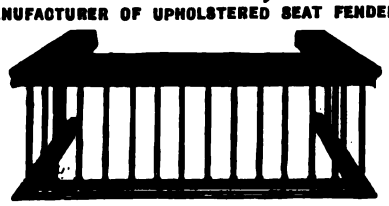
THE Local Government Board having approved of a scheme of sewage disposal for the town of Keswick, the contract for the work has been let to Mr. J. W. Broadhead, of Purston, Pontefract. The sewage will be lifted by centrifugal pumps driven by large gas-engines. The works have been designed by Messrs. D. Balfour & Son, consulting engineers, Edinburgh and Newcastle-on-Tyne.

THE Northampton Centre of the Institute of Sanitary Engineers have held a formal inaugural meeting in Northampton. A visit was paid to the Corporation refuse destructor, of which a description was given by Mr. A. Fidler. The destructor was put into operation in August 1903, and the plant consists of an eight-cell Heenan & Froude destructor, built in two units of four cells.

THE Fenny Stratford Urban Council have passed a resolution expressing their "entire satisfaction with the completed scheme for the sewerage and sewage disposal of our district, as designed and carried out by Mr. John Chadwick, civil engineer, of Bletchley and Victoria Street, S.W. The works have now been in use for over a year and are proving eminently satisfactory." The total cost of 20,800*l.* was below the estimates.



AT the last meeting of the Liverpool health committee it was pointed out that a considerable proportion of street works that were formerly carried out by the Corporation on behalf of the owners was now being done by contractors, the reason being that they objected to pay the extra cost entailed in the 4*s.* per day wage for Corporation workmen. The contractors got cheaper labour, and the result was that the Corporation workmen, for whom the 4*s.* per day wage was introduced, were not benefiting.



THE opening ceremony of the Long Eaton Primitive Methodist church took place on Thursday, the 22nd inst. The church, which is the first portion of a scheme embracing suitable school premises, has been erected under contract for 2,544*l.* by Mr. J. Bull, of Long Eaton. The church is designed in Late Gothic. A bold tower forms a feature at one corner. The building provides accommodation for about 500 persons. The architects are Messrs. George Baines & Son, 5 Clement's Inn, Strand, W.C.

THE public works committee of the Birmingham City Council recommend an expenditure of 42,796*l.* on street paving works. Owing to the reconstruction of many of the tramway routes, the committee have a large quantity of granite setts which, when redressed and relaid, will last for

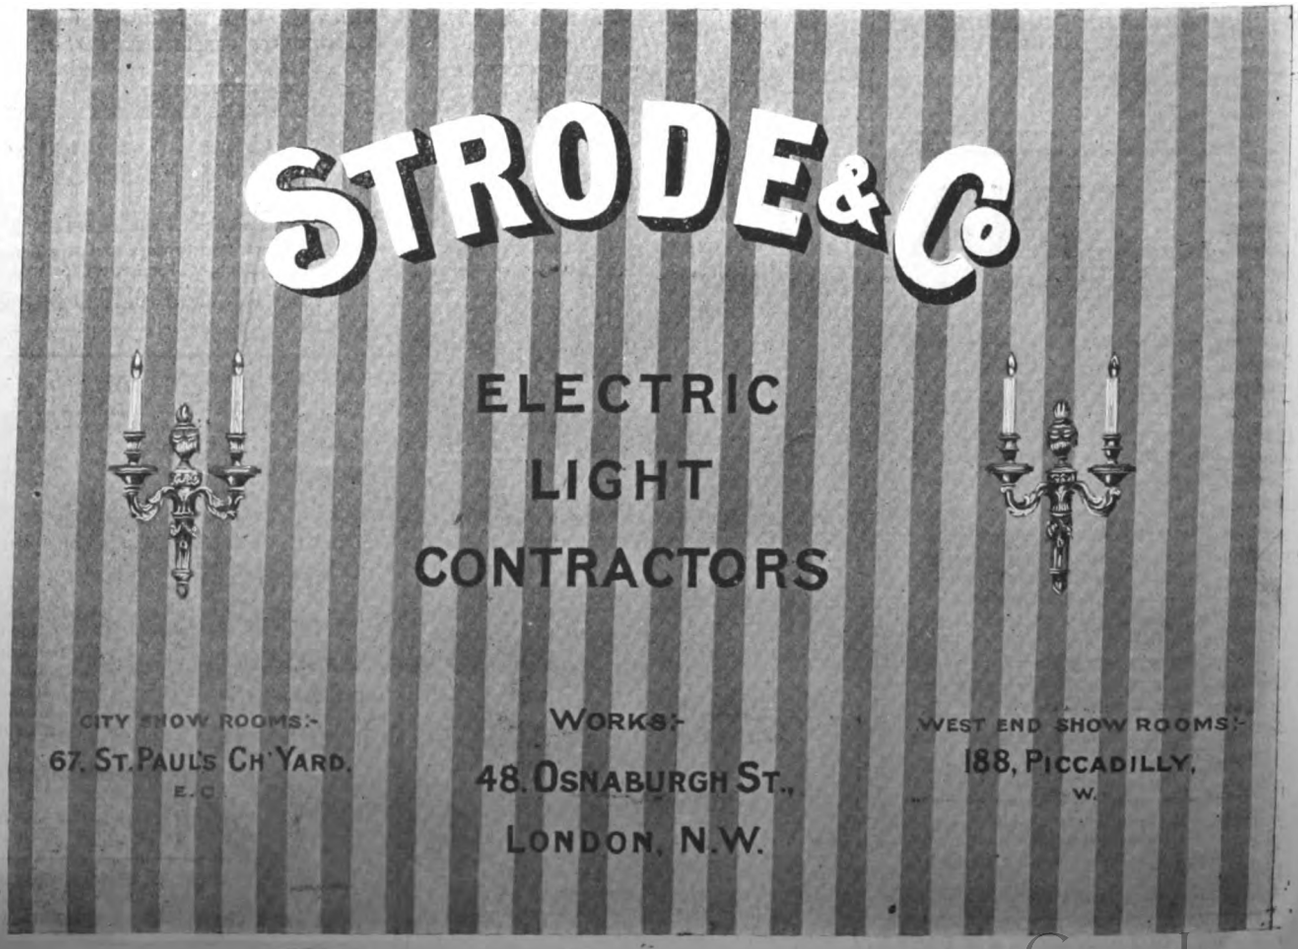
twenty years or more, and the Local Government Board have expressed their willingness to grant a loan for the purpose of such redressing and relaying.

THE Birmingham Tame and Rea District Drainage Board having applied to the Local Government Board for sanction to borrow 73,000*l.*, an inquiry was held on the 22nd inst. at the Council House by Mr. R. H. Bicknell. The Drainage Board require the money for the construction of storm-water filters and appurtenances capable of dealing with 100,000,000 gallons per day, and for the improvement of the present storm-water filters at Saltley in accordance with a scheme prepared by Mr. J. D. Watson, the engineer.

AT the Manchester police court a labourer was charged with stealing fire ranges and ovens from unoccupied houses in Hulme. The man had, it was said, been convicted of lead stealing, and came out of Strangeways prison on March 6 after serving a month's hard labour. He was arrested the same day. The practice followed by the man, it was said, had been to get the keys of unoccupied houses from the persons having care of them on the assumption that he had been sent to do repairs. He was committed for nine months with hard labour.

A DEPUTATION, representative of the Association of Chambers of Commerce and of the leading industrial associations intimate with the working of the Patents Acts is to wait upon the President of the Board of Trade on April 9. The object of the deputation is to convince Mr. Lloyd-George of the necessity of legislation to compel patentees to work their patents in this country, and not continue indefinitely to supply the British consumer from works established abroad. The contention of the deputation will be that such patents should lapse automatically.



THE Johannesburg Master Builders' Association, at a meeting on February 28, resolved to send delegates to a meeting of public bodies and institutions to be held in Johannesburg, when resolutions will be proposed for submission to the High Commissioner, pointing out that the present political uncertainty in the Transvaal is having most injurious results, and that "the effects of suspense are such that it is of the utmost importance that a decision should be taken with the least possible delay, and some stable form of Government and policy be established."

A REQUISITION signed by twelve members of Greenock Town Council has been presented to Provost Denholm, Greenock, asking him to call a special meeting of the Council for the purpose of instructing the Master of Works to prepare a case for the Court of Session in relation to the interlocutor by the Dean of Guild granting to Messrs. M'Alpine power to erect blocks of tenements at Bogston with hollow instead of solid walls, as heretofore has been the custom. Objections had been taken by the Master of Works to the building of hollow walls, but this appeal was set aside by the Dean.

THE building committee of the Glasgow and West of Scotland Technical College reported at the last meeting that the amount of the accepted tenders for the various classes of work in the college buildings amounted to 141,014*l.* 7*s.* 1*d.* The total value of work done, according to the final measurements, was 151,318*l.* 0*s.* 3*d.* The extra cost over the accepted tenders was therefore 10,303*l.* 13*s.* 2*d.* Nearly the whole of that extra cost had been incurred in connection with the contract for masonwork. The committee has been authorised to enter into contracts for the erection of the centre block of the new buildings up to the damp course.

THE new headquarters of Glasgow police force in St. Andrew's Square have been completed. The central police court sat in the building for the first time on Friday. The ground occupied by the buildings extends in all to about 3,550 square yards, and is completely separated from other buildings by a high wall, except on the north-west corner, which is built up to the Improvement Trust tenements. The cost of the buildings will amount to about 40,000*l.* The plans were prepared and the buildings carried out under the direct supervision of Mr. A. B. M'Donald, M.Inst.C.E., city engineer.

MR. WILLIAM DONALD, a Scotch road contractor, while travelling by train to Shettleston, where he was to carry out work, lost his pocket-book containing several accounts and documents and a sum of 600*l.*, consisting of four 100*l.* notes, nine 20*l.* notes and twenty 1*l.* notes, which he intended depositing in the local bank for convenience in paying his men. The police and the railway officials were unable to get a clue to the book. Last Sunday morning the pocket-book was on the lobby floor of his flat, found as if

Digitized by Google

it had been dropped through the letter-box during the night. It contained the four 100*l.* notes and several accounts and documents, but the smaller notes were missing.

THE Edinburgh District Lunacy Board have considered a communication from the General Board of Lunacy on the subject of the capacity of a recreation hall to be erected at Bangour asylum. The letter states:—"The Board adhere to their opinion that a hall for 720 persons would not be too large eventually, and they are the more convinced that it would be prudent to erect a hall for not less than that number from the fact that any subsequent extension rendered necessary by increase of population would be a difficult and expensive matter to carry out. The Board are of opinion that a hall to seat 572 persons would soon prove too small, but on the other hand they think that a hall to suit 720 persons would be found sufficient for many years." The recommendation will be acted upon.

A PUBLIC inquiry was held at Bournemouth on Monday by the Light Railway Commissioners respecting the application for an order for the construction of a light railway about twelve miles long from Bournemouth to Swanage *via* Branksome Park, and across Poole Harbour by means of a conveyor bridge of 400 feet span and 120 feet in height, the total estimated cost being about 200,000*l.* Sir John Mowlem, Bart., was one of the promoters. Strong opposition was offered by Bournemouth and Poole Town Councils, Poole Harbour Commissioners, London and South-Western Railway, many other public bodies and merchants. After hearing the case for the promoters, the Commissioners decided, in view of the strong local opposition, that they were not justified in granting the order.

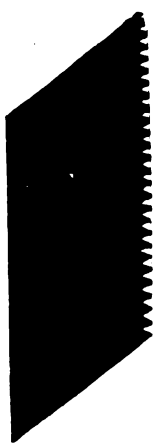
THE public analyst of Birmingham experimented on eight lined kettles, to ascertain if water obtained from the Welsh supply when boiled in them became objectionable for potable purposes. Galvanised iron kettles were found to yield a dangerous amount of zinc to water. The tin lining of four kettles contained an appreciable amount of lead, but the kettle lined with enamel was found to be satisfactory. The results of monthly analyses of ordinary tap water taken from different levels convince the analyst that the city has now the great advantage of a pure supply of soft water. Speaking of the possibility of lead being present in soft water supplied through pipes, the analyst advises consumers not to use for drinking purposes the first quart drawn from the tap in the morning.

THE tenth annual report of the Chief Registrar of Friendly Societies concerning the building societies, and referring to the year 1904, issued on Tuesday, showed that there were 1,798 such institutions making returns in England and Wales, having a total membership of 505,761, a total income for the year of 18,201,339*l.*, and advancing on mortgage 8,462,702*l.* The liabilities of the whole of the societies making returns was 49,784,070*l.*, and the assets 49,683,436*l.*—a total balance deficit for England and Wales of 100,634*l.* The deficit is spread over thirty-nine of the fifty-two counties. Scotland has 134 societies making returns, with 32,863 members, an income of 679,851*l.* for the year, and advancing on mortgage for the same period 245,065*l.* Ireland has eighty-two societies making returns, with 15,085 members, an income of 530,378*l.*, and 214,909*l.* advanced during the twelve months. Both Scotland and Ireland show a small balance deficit.

ON Saturday the estimates for the Civil Services for the year ending March 31, 1907, were issued. The net total of the estimates is 29,316,629*l.*, the original estimates being 28,614,221*l.* The increase is therefore 702,408*l.*, of which 651,117*l.* arises under the heading "Education, Science and Art." The total sum required under public works and buildings is 2,790,280*l.*, being an increase of 86,247*l.* on the amount voted in 1905. The increase of 3,500*l.* under royal palaces is due to the relatively large provision required for works of repair and for drainage. Under art and science buildings there is a net increase of 23,628*l.*, which is more than accounted for by the sums required for the new building of the Royal College of Science; 20,000*l.* less has been taken for post office and telegraph buildings, namely, 380,000*l.*, as against 400,000*l.* in 1905-6. On the other hand, the provision for purchase of sites under the Post Office estimate has been raised by 25,000*l.* The estimate for public buildings shows an increase of 53,000*l.*

THE Westminster City Council at their last meeting considered a letter from the London County Council in view of the fact that premises on the south side of Piccadilly to the west of St. James's Street are about to be rebuilt, and asking whether the Westminster Council, in the event of the central authority undertaking an improve-

"MAXIMUM LIGHT GLASS."



LENSES AND PRISMS COMBINED IN ONE SHEET.

ABSOLUTELY THE BEST FOR DAY-LIGHTING DARK INTERIORS.

Increases the Daylight from 5 to 20 times.

By reason of a lens surface running vertically on the outside and at right angles to an interior prismatic surface, this glass possesses a double refractory power.

All the light from the sky is gathered, projected, and completely diffused.

The use of the "Maximum Light Glass" lessens the cost of artificial lighting.

Supplied in ordinary window-glass sizes.

Also in ornamental designs in lead or copper.

ment to increase the width of the thoroughfare to 80 feet, would assist in effecting the improvement by exercising, if necessary, any statutory powers which it may have for the compulsory acquisition of all or any of the interests in the property required. The City Council resolved to inform the County Council that Westminster was prepared to make a special contribution towards the cost of the proposed widening, and would exercise statutory powers for compulsory acquisition of the property if necessary.

THE National Association of Master Plumbers of Great Britain and Ireland have issued a circular stating that they have learnt that the Worshipful Company of Plumbers, London, are seeking to induce local authorities to insist that none but plumbers registered by them should be employed to execute work on behalf of the authority. The master plumbers in their National Association object strongly "to be put under the dominion of the people who have present control of the Worshipful Company, because they do not, in our judgment, represent the trade, and the registration system of every other profession is in the hands of the profession themselves. The present system is a most imperfect one in many respects, and it would be most unjust to respectable tradesmen to impose it upon them." The secretary adds that the Association hope shortly to have arrangements completed for opening a register for the purpose of registering *bona-fide* master and operative plumbers.

IT is officially announced that the Irish International Exhibition will be held in Dublin during the summer of 1907. The enterprise has been so favourably regarded that nearly one thousand guarantors, representing all classes of the community, have subscribed to a guarantee fund, which already exceeds 150,000*l*. The objects of the exhibition are:—1. To promote and foster the industries, arts and science of Ireland by a display of the products for which the country is famous, and of the products of partially developed industries for which special facilities exist in the country. 2. To stimulate commercial development and to promote industrial education by inviting all nations to exhibit their products, both in the raw and finished state. A fine art section will form an important and attractive part of the exhibition. For the accommodation of art treasures a special building will be erected, and the amplest precautions will be taken for the security of valuable property loaned for the exhibition. The exhibition will contain all the sections usual in an international collection of this kind.

AN account prepared by the War Office under the provisions of the Military Works Acts, which was issued on the 19th inst., shows that up to March 31, 1904, the amount issued to the War Office was 10,223,216*l*., and that in the year 1904-5 a further sum of 3,500,000*l*. was issued. The total expenditure to March 31, 1905, was 13,322,969*l*., and the balance remaining unexpended of the total amount authorised was 7,487,530*l*. The money has been spent as follows:—Defence works, 2,557,461*l*.; barracks (including completion of large camps), 8,192,937*l*.; ranges (including accommodation for manœuvring and mobilisation), 2,041,528*l*.; and staff and contingencies, 531,042*l*. The expenditure at Wei-hai-Wei is set down as 52,633*l*. The Auditor-General in his report calls attention to the character of some of the expenditure. Thus hutments erected in great haste at Longmoor to accommodate troops returning from South Africa were found to have been built in swampy and otherwise unsuitable ground, and had to be removed to Bordon at a cost of 7,529*l*. Then extra contracts have, without competition, been given to men who have contracted to do specific work. The estimated value of extra work given to one contractor without competition was over 42,000*l*., as compared with the amount of his original contract, 28,150*l*.

NEW CATALOGUES.

THE "Manchester Grate" has won such general approval by its heating and ventilating qualities it may seem to have established itself, and that no change or alteration is necessary. Messrs. E. H. Shorland & Brother have, however, brought out a supplementary catalogue, which presents the latest forms adopted. The designers boldly dispense with front bars, because they were considered to be an obstruction to the radiation from the fire. The curved fire-tile at the back allows of the change, and the warm air is disseminated into the room through a grid. In another grate (195) an iron chimneypiece with projecting

canopy can be used, and the price is somewhat cheaper than with glazed bricks. There are other varieties, all possessing a satisfactory appearance as well as efficiency. The exterior of the Manchester stove is made of tiles, and it rests on a concrete hearth. The heat issues from a grating on the top, and as the doors can be left open there is the cheerful appearance of a fire which English people value, although in other countries there is indifference to the ruddy glow. The new designs for the exhaust ventilators Nos. 211 and 212 are well adapted for modern buildings. They have a substantial look which does not diminish their pneumatic power. Other items in the catalogue are the "Louvre" grid, made especially for hospitals, schools, &c., and which can be obtained from the small sum of 2*s.* 6*d.*, and an aluminium "Hit-and-miss" grid, both being excellent aids to ventilation.

To do justice to the catalogue of Messrs. J. H. Sankey & Son, Ltd., would be to write a treatise on fictile industries in relation to building. Bricks, cements, fireclay goods and sanitary goods are shown in so many varieties, the index alone requires twelve columns. A glance over the pages of the catalogue will convey more information than could be presented in our limited space. At one of their offices they give a practical illustration of materials by uniting a house with walls of ordinary white gaults to one of buff terra-cotta bricks. The firebricks of the company are used for the lining of furnaces of water tube and other boilers with success. Silica bricks are also manufactured by them which will resist a temperature that melts ordinary fireclay bricks. Another specialty is the acid and alkali resisting brick. Drainage pipes, channel interceptors, ventilating shafts, chimney-pots, gullies and sanitary appliances of all necessary kinds are comprised in the pages. They also supply roofing slates of the varieties in general use; among them may be mentioned Angiers slates, which are in favour with French architects. It is claimed for them that they are unaffected by acids and alkalies, that the crushing strain is equal to granite, and the breaking strain exceeds that of the best oak. Among the specialties of the company are the improved Louvre chimney-pot, patent intercepting gully and improved stoneware sink-trap, hollow partition blocks, &c. Messrs. J. H. Sankey & Son have recently opened depôts at Hendon (Midland Railway goods station) and at Beckenham Junction (South-Eastern and Chatham Railway).

WE have received from Messrs. J. B. Joyce & Co., clockmakers, of Whitchurch, Salop, their catalogue of turret and church clocks; the firm has been established for over 200 years. From the introduction to this catalogue we append the following most interesting details:—"In the year 1288 an order was served upon the Chief Justice of the King's Bench to furnish a clock for the clock house, near Westminster, and in 1368 Edward III. granted a protection to three Dutch clockmakers or horologists. Doubtless this was the commencement in England of a trade which has since been so greatly developed. It would be tedious to follow all the improvements which have been effected since the above-mentioned clock was fixed in the old tower at Westminster down to those which characterise the large clock now in the Victoria Tower; but perhaps the greatest improvement has been the gravity escapement invented by Lord Grimthorpe. One of the first of these escapements was made by the late Thos. Joyce, of Whitchurch, from a drawing by Lord Grimthorpe. A good turret clock should combine the greatest accuracy of rate with durability of material, and should be affected as little as possible by external influences. The greatest accuracy of rate is obtained by Lord Grimthorpe's gravity escapement. By this means the pendulum receives impulse from two gravity arms acting alternately upon each side, and as these arms are lifted to exactly the same height by the going train of the clock, the arc of the pendulum would not be affected whatever amount of stress may be put upon the going train of the clock. To compensate for the changes of temperature the pendulum is made of zinc and iron tubes. These tubes are arranged so that whilst the expansion of the one tends to raise the centre of gravity, that of the other tends to lower it, thus keeping the centre of gravity always in the same place. The pendulum bob of a turret clock with gravity escapement should not be less than 2 cwt., and in a very large clock not less than 3 cwt. These pendulums can be regulated to the greatest nicety by adding or subtracting

small weights. A clock should be constructed to do its work with the least possible amount of friction. To insure this the wheels should be of gun-metal, a pure mixture of copper and tin, each tooth being separately cut in an engine, so that the teeth may be perfectly uniform. Cast-iron wheels are subject to all the variations of shrinkage and other imperfections in casting, which cannot always be detected until a breakage occurs, and require much greater weight to drive. The pinions should be those known as lantern, with each leaf separately hardened and tempered as explained in Lord Grimthorpe's book on clocks. The frame of the clock should be of cast-iron planed true on the surface. All the arbors should be of steel, and the pivots should run in gun-metal bearings In asking for an estimate for a clock the number and size of dials should be given; or if the size is not decided upon the number of feet from the ground at which it is proposed to place them; whether the clock is to strike the hours only or with quarters or chime quarters; also the weight or diameter at the mouth of the largest bell. If possible the perpendicular fall for the weights should be given; the greater the fall the less weight required to drive the clock, which means, of course, less wear and tear. For small clocks that are only required to turn dials of about 3 feet diameter and strike on bells up to about 5 cwt., the dead beat escapement is found suitable to perform all that is required. The clock is in every respect the same as the gravity clock with the exception of the escapement and wood-rod pendulum. This can easily be regulated to ½ minute a month. This escapement is also largely used for railway clocks." Messrs. Joyce supplied the clocks for Worcester, Chester, Chichester, Salisbury, Lichfield and Bangor cathedrals, for many other prominent buildings, including Glasgow University and Sydney Government Buildings, Australia.

HEIGHT OF MANUFACTURING BUILDINGS.

THE height of a manufacturing building for a one-storey structure, writes Mr. J. H. Edwards in the *Engineering Record*, is usually considered the distance from the ground-floor to the lowest part of the overhead roof supports, while for structures more than one-storey high it is the distance from finished floor to finished floor, the effective height being reduced by the thickness of the floor construction. Proper lighting, heating, ventilation and the character of the product, together with its method of manufacture, are the factors determining the height of a factory building. Such a structure in its simplest form is a house to protect the workman and his tools from the variable conditions of the weather. From this simple type progression is made by various stages to the structure which is a great tool in itself, specially adapted to produce, with the machines it contains, the plant's output at a minimum cost.

For proper lighting, other considerations being neglected, and providing light is not obstructed by adjoining buildings, an ordinary shop building should have a clear height of about one-fourth of its width. This applies to buildings up to the limit of simple spans, or 100 feet wide and less. On this basis a building 50 feet wide should not be less than 12 feet high, which should be the minimum of any building in a temperate climate. For structures in tropical countries the minimum should be 15 feet. A building 80 feet wide should be 20 feet high, and for 100 feet width 25 feet would be the height for single structures, proper lighting and ventilation only being considered.

The above observations have been made with one-storey structures in mind, but they also apply to the upper storey of buildings of more than one storey. The height of the lower storeys should be increased over the dimensions determined as desirable for a one-storey structure used for the same purpose, with the lower storey the highest. This increase in height is to obtain light, and the practice is to increase the storey next to the top, say 2 feet, while the bottom storey, to obtain equally good light, should be 4 feet higher than the top storey.

The heating of buildings in cold climates is a feature to be considered, and in some localities is a maintenance expense that assumes serious proportions. The greater the height of a building the more heat required, so from a financial standpoint it may be advisable to reduce to 18 feet the height of a building 80 feet wide, and forego some of the advantages of better light obtained by a higher structure.

When a building is considered as a part of the

Digitized by Google

mechanical equipment, the character of the product and its method of production should be the governing factors in determining the height. The framework may support the shafting and the trolley runways, or it may be arranged for travelling cranes. The proper disposition of these features is of vital importance.

If the building is to carry shafting supported from the girders or trusses overhead, a clear height of 14 to 16 feet should be maintained. If trolleys for light work are operated on runway beams attached to overhead supports, 16 feet is usually the minimum height, while for heavy work or handling large pieces the trolley beams should be 20 to 24 feet high.

When travelling cranes are installed, the height must be determined by the capacity of the cranes and the methods of handling the work required for the shop's product. The customary practice for ordinary work is to obtain a height of about 20 feet under the crane, which means a height of building of 24 to 30 feet. This is the usual construction for machine shops and foundries. As the product to be handled increases in size and the cranes in capacity, the heights necessarily increase. Buildings designed for special purposes, such as erection-shops for engines, pumps and electrical machinery, are fixed in their height wholly by the space required to assemble the work conveniently. These buildings are often equipped with cranes at two levels, a lower one at the ordinary machine shop level, 20 to 24 feet from the floor, and an upper crane sufficiently high to pass over the lower one, or 30 to 35 feet from the floor. Such a building will have to be 40 to 50 feet high.

Boiler shops where extreme sizes of marine boilers are made require a height of about 60 feet, and are the highest of the manufacturing buildings usually encountered.

Assuming usual conditions, a manufacturing building erected in the open one storey high, with a width of from 60 to 70 feet, having shafting attached to the roof supports and provided with overhead trolleys, should have a clear height of about 16 feet. If the machines in such a building are all motor driven and no overhead shafting or belting is required, this height had better be increased to 18 feet. Smith shops and foundries should be somewhat higher than machine shops in order that better ventilation may be secured.

The limits of this article will not permit taking up in detail the different classes of manufacturing buildings and giving an example of each under its possible conditions, therefore only a brief outline has been attempted. The tendency is to make buildings too low. It is better to be liberal in this feature, then as the product increases in size, as it usually does, the structure can be readily adapted to the changed conditions.

MUNICIPAL BUILDINGS, GERMISTON, SOUTH AFRICA.

A COMPETITION for municipal buildings having been arranged by the Council of Germiston, Mr. T. A. Moodie was engaged to examine the designs. The following is a copy of his report :—

I have studied the conditions of competition which were issued to the various architects, and consider that they are very fair, the only point I should like to raise being the question of cost. The necessary accommodation was stated in the conditions, but I am of opinion that the amount stated, namely, 7,000*l.*, less architect's fees, is not sufficient to erect a building with first-class material and workmanship of the size specified. In their reports the various competitors state that their designs can be erected for the amount stipulated, but it must be borne in mind that only a specification of the best material and workmanship can be accepted for an important building of this class, otherwise the maintenance will be heavy and out of all proportion to the cost of the building. Coming to consideration of the designs, twenty-nine sets have been submitted, all of which show very creditable solutions of the problem. I do not consider it necessary to go into the merits of each one of the twenty-nine sets, but will rather confine myself to the best of these. The design submitted under the *nom de plume* of " Pip " shows a very fine composition in two storeys, and is the best architectural scheme submitted. My opinion is that this design will cost considerably more than 7,000*l.*, but in view of the author's assertion in his report that he has been fortunate in getting an estimate from a reliable builder for the amount stated in the conditions, I recommend

that this design be awarded first place. The plans are very conveniently arranged, the Council chamber, mayor's parlour and the committee-room forming a very fine suite of rooms on the first floor, while the different departments are well grouped on the ground floor, and the outhouses are exceptionally well arranged. The design submitted under motto "Syntax" shows a single-storey building with very good plan and suitable elevations. The open corridors to side wings are a feature of this design, while the departments are very conveniently arranged. This is the best design for a single-storey building submitted in the competition, and I have no hesitation in placing it second. I had greater difficulty in placing the third design, as the three following are almost equal and all show buildings which, if erected, would be quite suitable. These are "Anon," "Ginger" and "Claymore." In deciding between these three, I have chosen the simplest and the one which would cost the least, namely, "Anon." This is a good design of one storey, with plan well arranged and elevation quiet and well suited for a building of this class. Design marked "Ginger" shows a double-storey building with suitable plans, but elevation rather too imposing and costing considerably more than 7,000*l.* "Claymore" shows a well arranged plan with large circular entrance on the angle, and the elevations, although severe, would not be at all out of keeping. "Gold Medallist" and "Waverley" come next, both of those with suitable plans and elevations. I do not consider it necessary to discuss any more of the designs, and therefore award the first prize to "Pip," second to "Syntax" and third to "Anon." I consider it is a matter for congratulation that so many good designs have been submitted in answer to your advertisement. The winners of the first prize, whose design has been adopted, are Messrs. Arthur and William Read & East, of Johannesburg.

GROWTH OF LIVERPOOL.

ACCORDING to the report of Mr. William Goldstraw, the city building surveyor, during last year no fewer than 2,186 houses were erected in Liverpool. Although this only shows a slight advance as compared with 1904, nevertheless the total was 251 above the average for the previous nine years. On two occasions within the last decade the number has been exceeded, viz. in 1899, when the total was 2,358, and in 1903, when it was 2,453; but it is interesting to note that last year's figures were nearly 1,000 in advance of the total for 1896, the year after the city was extended. During the past four years, however, says the *Liverpool Courier*, the growth of the city as a whole has been pretty steady, but the expansion is far from being uniform in the different parts thereof. This is evidenced by the following figures for last year for the separate divisions:—West Derby, 577; Walton, 452; Toxteth Park, 445; Wavertree, 265; Garston, 236; and the old city, 211 (which includes 108 labourers' dwellings erected by the Corporation, counting each tenement as a house). As compared with 1904, these totals show increases in two instances—Toxteth Park 316 and Garston 86, while there were decreases in West Derby of 47, Wavertree 64, Walton 73, and the old city 206. Still, West Derby as in 1904, heads the list, which is due to the fact that new estates have been opened up. The large decrease in the old city, it is stated, is evidently owing to the slackening in the building operations of the housing committee. Taking the past eleven years from 1895 to 1905 inclusive, the total number of houses erected has reached the enormous number of 20,155, of which 4,550 were in Wavertree, 4,343 in West Derby, 4,272 in Walton, 3,794 in the old city, and 2,511 in Toxteth Park, whilst in Garston during the past three years the total has been 685.

Turning now to the question of rentals, it is noted that, as in former years, by far the greatest number of houses put up are of rental from 18*l.* to 25*l.*, though the number of this class was only 872 as against 1,067 in the previous year. Another class of rentals, comprising those under 12*l.* shows a notable falling off from 258 to 78, all the latter of which were "labourers' dwellings," built by the Corporation, as were also 30 others of 12*l.* to 18*l.* rental. The houses rented at 12*l.* to 18*l.* have increased from 284 to 394, including the 30 Corporation dwellings referred to; there was an increase from 449 to 638 of those let at 25*l.* to 35*l.*, and from 116 to 204 of those let at 35*l.* and upwards. Taking those let at from 12*l.* to 25*l.*, the total is 1,266, which is below the average, viz. 1,278 for the preceding nine years.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy Work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

Telephone No. 4725 Holborn.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

NOTICE.

Next Friday being Good Friday, THE ARCHITECT *will be published on Thursday. All advertisements intended for this Number must reach the Office not later than* 4 P.M. *on Wednesday, April* 11.

No alteration of advertisement copy can be allowed after Saturday morning, the 7th inst.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1s. The Town Clerk, Council House, Birmingham.

WOOLWICH TOWN HALL: COMMITTEE SUITE OF ROOMS.

CATHEDRAL SERIES.—TRURO: WEST FRONT.—SOUTH PORCH.

A REALISATION OF BACON'S IDEAL MANSION

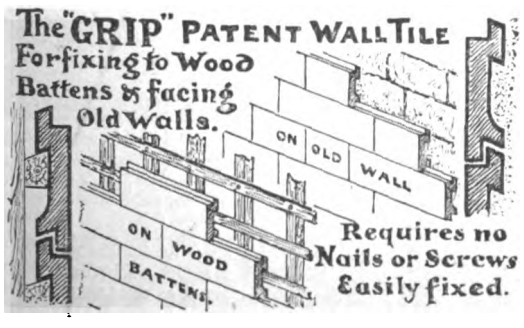
ELECTRIC NOTES.

The electricity committee of the Manchester Corporation has resolved to recommend the Council to make application to the Local Government Board for borrowing powers to the amount of 63,000*l.* for electricity purposes.

The Swedish Government desire to obtain sanction for a Bill authorising the acquisition of waterfalls belonging to private owners for the purpose of obtaining power for working the electric State railways. The immediate expenditure is believed to be 277,000*l.*

The experiments recently carried out in Canada with electric smelting appliances were made at the expense of the Dominion Government, with a view to the development of the iron ore industry in the Ontario district. The results of the experiments are said to be definite and conclusive, and the Government are satisfied that the treatment of ore by electricity could be profitably and lucratively carried out.

At the town hall, Dudley, Mr. H. Ross Hooper, on behalf of the Local Government Board, held an adjourned inquiry on the 30th ult. relative to the application of the Town Council for permission to borrow 22,000*l.* for purposes connected with the electrical undertaking. The Council require 11,677*l.* to cover excess of expenditure on previous work, for which money was borrowed, 9,322*l.* for new work and 2,000*l.* for cables.



The numerous attractions of Vienna (writes a *Pall Mall Gazette* correspondent) will shortly be increased by the opening of an illuminated fountain, which will be the largest and finest in the world. It will stand on the Schwarzen Bergplatz, one of the most prominent and beautiful spots in the city. The machinery for pumping and electric lighting is now being installed in a concrete chamber under the fountain, and the illuminating power will be equal to 900,000,000 candles. It includes twenty-seven immense reflectors capable of giving seventy variations in light effects every seventeen seconds.

Mr. Justice Bigham heard an action at Leeds on Saturday in which a firm of wool merchants, of Bradford, sought to recover 156*l.* 14*s.* from the Bradford Corporation as damages sustained by them owing to the alleged negligence of the Corporation in laying down electric cables. For the plaintiffs it was stated that an explosion occurred on December 8, 1904, which severed the connection between the electrical mains and the plaintiffs' premises. As the plaintiffs depended upon electricity for lighting and motor-power, their business was suspended for three days and a half. The defendant Corporation, it was contended, knew of the defects in the cables. On behalf of the defendant Corporation the damage was denied, and it was submitted that it was caused by the explosion cutting off the connection of electricity. His Lordship, in giving judgment for the defendants, said that if the action succeeded he did not know where the liabilities of the Corporation would cease. They would be so great that it would be almost impossible for them to carry on their business.

The tramways committee of the Birmingham Corporation report that the work of constructing the tramways authorised by their Act of 1905 has been proceeded with as rapidly as possible. The following tenders have been accepted:—Lodge Road, W. Griffiths & Co., 14,289*l.*; Bordesley Green, Holloway Head, Bolton Road, Thimble Mill Lane and Leopold Street, John Aird & Co., 43,698*l.*; Saltley Road and Washwood Heath and Alum Rock, John Aird & Co., supplementary contract at schedule rates given in principal tender; Cannon Hill Park route, Dick, Kerr & Co., 6,235*l.* The contract price does not include the cost of rails and paving materials. Many representations have been made to the committee requesting that in various roads the lines may be laid in wood blocks instead of in granite. Both systems have existed in the city for several years past, although the wood-paved sections are comparatively small. It is found that granite setting is so much more durable that the cost of maintaining a line set in wood exceeds the cost of a line set in granite by from 200*l.* to 250*l.* per mile of single line per annum. The committee

London Showrooms: 2 & 3 NORFOLK STREET, STRAND, W.C.

Digitized by Google

are unable to recommend that the line should be set in wood blocks except in front of places of worship, public hospitals and buildings of a like character, in respect of which exceptions have always been made. The committee decided wherever possible to adopt the span-wire system with side poles as the most efficient method of overhead equipment. The trolley wire will be 0000 S.W.G. grooved wire for mechanical ears, with a breaking strain of about 3 tons, in preference to the ordinary round wire with soldered ears. The new system for supporting the trolley wires has been found to give the best results and to minimise the danger of fractures taking place at the ears. Tenders were obtained for carrying out this work on the reconstructed lines and on the new tramways in course of construction, about forty-four miles of single track, and the tender of Messrs. Dick, Kerr & Co., at 27,231*l.*, being the lowest, was accepted.

VARIETIES.

A BUILDING TRADES EXHIBITION will be held in St. James's Hall, Manchester, from April 25 to May 5.

THE Worcester City Council decided on the 3rd inst. to protest to the Postmaster-General against the proposed elevation of the Central post office as being unworthy.

THE Nottingham Corporation have had under consideration plans for a music-hall proposed to be erected on a site already acquired in Lower Parliament Street. The architects are Messrs. Crewe, Briggs & Parkes, London.

THE Edinburgh Corporation recently refused to grant permission to a firm of billposters to use hoardings on a site at Gorgie Road. An appeal to the Sheriff Court was made. In the judgment, which was delivered on Monday, the decision is upheld.

THE Lincoln Corporation have obtained a seemingly abundant supply of water from the well sunk at Boultham to a depth of 1,502 feet, which is said to be the deepest in the United Kingdom. The work has been carried out by Messrs. C. Chapman & Son, of Salford.

THE borough surveyor of the West Bromwich Town Council has completed a plan showing the position of old pit shafts and disused wells in the borough as far as his information has enabled him. The committee asks for further information as to the situation of pit shafts and wells.

A SCHEME is in progress for the erection of a building near the Strand for the use of the Young Men's Christian Association, to replace Exeter Hall, which will shortly be demolished for street improvements. The fund would be a memorial to their founder, Sir George Williams. It is desired to raise the sum of 105,000*l.*

THE War Office has called for lists of all the larger barracks in the home commands, distinguishing between those built before 1875 and those built in that year and since; also for statements of the money expended in their maintenance during each of the last ten years, to ascertain as near a percentage as possible of the cost of maintenance.

THE President of the Board of Trade has stated that he is not prepared to recommend the imposition of a duty on slates imported from abroad. The value of the slates brought into this country during the past five years has been:—1901, 273,000*l.*; 1902, 286,000*l.*; 1903, 467,000*l.*; 1904, 340,000*l.*; 1905, 262,000*l.*

THE promoters of the Channel Tunnel scheme intend to test the feeling of Parliament by means of a resolution declaring the expediency of allowing the scheme to proceed. In the event of a favourable reception plans and sections will be deposited in November. It is suggested that the capital will be 6,000,000*l.*, of which half will be raised in England and half in France.

FOR the new infirmary to accommodate 800 patients at Edmonton, Middlesex, the following five architects have been selected to compete:—Messrs. Marcus Collins, Stuart Hull, W. A. Pite, A. E. Pridmore and W. H. Ward. Each competitor receives 75 guineas; the successful one will be paid 5 per cent. up to 100,000*l.* and 3 per cent. on the remainder.

The Tees Conservancy Commissioners were informed on Monday that negotiations had been completed with Smith's Dry Dock Company, Ltd., of North Shields, for the purchase of 15 acres of Tees foreshore at Middlesbrough for the construction of dry docks and a shipbuilding yard. The docks will be built to take the largest vessels trading on the north-east coast.

A school of sanitation has been attached to the Royal Army Medical Corps for the purpose of training men in every arm of the service to supervise the sanitary arrangements in camp and to attend to the purification of the water-supply. Lieutenant-Colonel R. H. Firth, who was professor of hygiene at the Royal Army Medical College in London, has been appointed instructor at the school.

In the course of excavations at Capetown for railway buildings some workmen recently found a number of the old "post-office stones." The commanders of the English and Dutch East India Companies' fleets used to leave a package of letters under large stones on the shore, to be taken to Europe by the next home-going fleet. These stones bear rudely carved inscriptions asking the passer-by to "look hereunder for letters."

A list of claims for compensation for loss of property sustained by subsidence through brine pumping within the Northwich Salt Compensation area was issued on Saturday. The total claims number 112, the amount asked for to cover the year ending March 1 being 3,864*l.* The largest individual claims are for 500*l.* and 400*l.* The Salt Compensation Board, which administers Northwich's unique Act of Parliament, will adjudicate upon the claims and grant allowances. The Compensation Fund is raised by a tax not exceeding 3*d.* per thousand gallons on all brine pumped.

A new Glasgow Corporation reception-house for the isolation of smallpox and other contact cases has been opened in Baird Street, Townhead. The portion set apart for reception-house accommodation extends to 2,492 square yards, of which 1,004 is covered by buildings, the remainder being used as exercise courts. The total accommodation provides for 190 adults, exclusive of staff, and the scale of sleeping accommodation provides 400 cubic feet per adult in the bedrooms and 500 cubic feet in the dormitories.

The opening ceremony of the Sutton-in-Ashfield Congregational church took place on April 4. The building occupies a prominent corner site, and is designed in Late Gothic freely treated. The facings are of pressed red bricks and the dressings of Matlock stone. A lofty tower forms a feature at the corner of the block. The contract has been carried out by Mr. J. Greenwood, of Mansfield, the amount being 3,982*l.* The architects are Messrs. George Baines & Son, 5 Clement's Inn, Strand, London, W.C.

Mr. Duncan M'Kinlay, the chief sanitary inspector in the Upper District of the county of Renfrew, in the course of his annual report states that building operations throughout the district were more active than they were in any preceding year during the *régime* of the County Council. The plans approved of numbered 195, these providing for 881 dwelling-houses, compared with 495 in the previous year and 783 in the year before, together with other buildings. The estimated cost of the year's work amounts to 336,010*l.*, and the additional housing accommodation provided is equal to the requirements of a population of 4,320.

The report of Sir Alexander R. Binnie to the Lord Lieutenant of Ireland on the subject of the Bann and Lough Neagh drainage has been issued in a Blue Book. The total cost of the various works mentioned in the report amounts to 76,000*l.* Before, however, any contracts are let it would be necessary, Sir Alexander points out, that careful working drawings, plans and sections, with a detailed specification, should be prepared so that contractors may have exact and full information as to the work to be undertaken, thus avoiding as far as possible the introduction into the tenders of speculative prices.

Mr. Thomas Barclay, speaking at a meeting of Southall Bros. & Barclay, Birmingham, mentioned that one of the claims on behalf of the Birmingham Welsh water scheme was that because of the softness of the water it would cause a saving in soap to the consumers of approximately 35,000*l.* per annum. This was regarded as incredible at the time, but at the company's mills at Saltley, where a considerable quantity of water was required, through substitution of the Elan water for the old town supply there had been a saving in soap during the year of four tons, amounting to 100*l.*

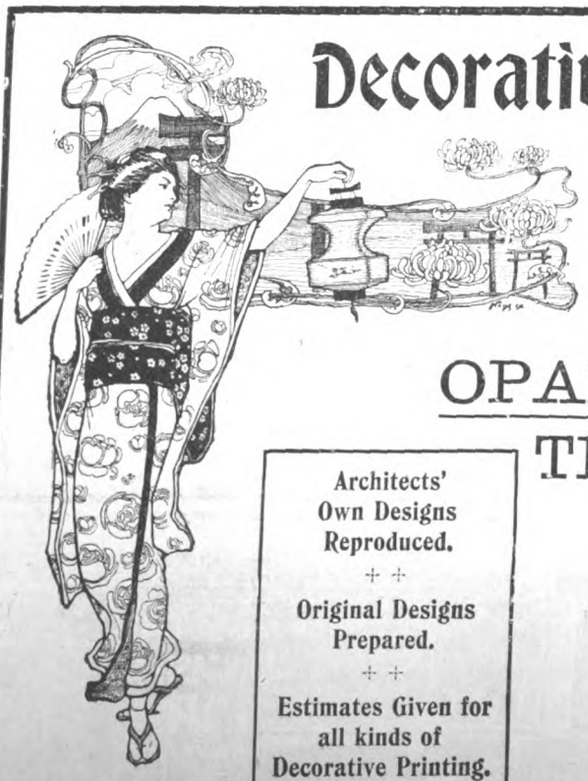
THE Warwickshire County Council through its surveyor, Mr. J. Wilmott, has selected a portion of the highway between Stonebridge and the entrance to Packington Park upon which to carry out a series of experiments with a view to ascertaining the best material to resist the motor traffic. One length of the road has been laid with a proprietary substance composed of slag and tar, another with Hartshill stone, a third section with Leicester granite and a fourth length with Clee Hill stone. These several lengths have been carefully made with the respective materials, and they will be kept under special observation to see which displays the greatest wearing qualities.

A SUPPLEMENTARY water supply for Malvern has been inaugurated. The two boreholes are at Bromsberrow, nearly nine miles distant, at the south end of the Malvern range, and the yield has been tested at 900,000 gallons in twenty-four hours. The main is divided into seventeen sections by sluice valves. Water is discharged into the British Camp storage reservoir, or into the clear water reservoir below, as may be required. The total cost of the works is about 25,000*l.* The Royal assent to the Act of Parliament was only obtained a little over seven months ago. The work has been carried out under the supervision of Mr. W. O. Thorp, the water engineer.



AT Wrexham last week a case came before his Honour Judge Sir Horatio Lloyd under the Workmen's Compensation Act. Counsel for the building employer said the case was a very hard one for his client, as if the proposed alteration to the Compensation Act was carried, his client would be excluded from the liability imposed by the provisions of the Act. His Honour Judge Lloyd said:—"I hope sincerely the clause you refer to will never become law. For the life of me I cannot conceive any reason why a builder who employs four men should be excluded from the provisions of the Act, whereas a man who employs five men will be liable for accidents to his employés. A very good thing would be to make insurance compulsory."

A SPECIAL committee of the Calcutta Corporation in discussing recently the difficulties in connection with the water supply draws special attention to the inferior plumbingwork. *Indian Engineering* states that the science of plumbing is one that is still almost wholly misunderstood by natives, who consequently cannot be got to take a real pride in sound work, and are disposed to wink at slipshod methods if they pass muster and prove remunerative. The European plumber, on the other hand, almost stakes his reputation on the quality of his work, and would absolutely do so as regards what is executed by his own hands, and he will at least do all in his power to effect sound work.

THE King's Norton Guardians at their last meeting considered a special report relative to the builders' tenders for additional infirmary pavilions and a new home for the nurses, and estimates for the heating system and hot-water supply. A tender amounting to 31,937*l.* was accepted, and plans for part of the scheme were referred back for alternative proposals to be prepared. The Board decided to apply to the Local Government Board for sanction to a loan for 44,000*l.*, repayable within thirty years, to cover the cost of the building contract, the provision of cold water and fire mains and hydrants, laundry fittings, cooking apparatus, electric lighting, lifts, telephones, roadmaking, furnishing, architect's charges, &c. The heating and hot-water systems to be installed will be the subjects of a separate loan.

THE Cardiff Parliamentary committee have considered an application under the Small Dwellings Act, 1899, which provides municipal corporations with power to assist a ratepayer to acquire a house not exceeding 400*l.* in value, the advance not to exceed four-fifths of the market value of the property, the loan to be repaid with interest within thirty years, the interest not to exceed 10*s.* above the rate at which the Corporation can at the time borrow from the Public Works Loan Commissioners, repayments to be either weekly or at any periods not exceeding a half year. The application was received from a carpenter for assistance to purchase a house at about 200*l.* The town clerk said they had had one or two similar applications before but they had not been complied with. The application was refused.

AT the annual meeting of the Land Law Reform Association that took place on the 28th ult., and was presided over by the Right Hon. Sir Walter Foster, M.P., the following resolution moved by Mr. J. S. Rubinstein was carried

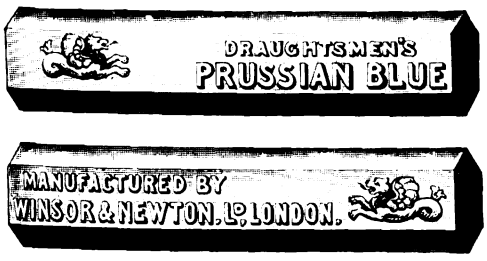
unanimously :—"That having regard to the fact that the imperfections, complication and dangers of the registration system have been so clearly pointed out and condemned by the judges in the recent cases of 'The Capital and Counties Bank *v.* Rhodes' (1903), 'Attorney-General *v.* Odell' (1905) and 'Marshall *v.* Robertson' (1905), this meeting hereby records its opinion that an inquiry as to whether the registration system can be so improved as to be made a simple and workable one should be ordered by the Government." The meeting further resolved that a copy of the resolution should be sent to the Prime Minister.



Judge Gye gave judgment at Basingstoke on the 2nd inst. in an action brought by the Basingstoke Corporation against Mr. H. Andrews in respect of water supplied for domestic and trade purposes. The defendant had declined to pay the meter charges on the ground that the water was contaminated and that his nephew had consequently suffered from typhoid fever. There was an epidemic of typhoid fever in Basingstoke last autumn. For the Corporation it was contended that the defendant, having taken the water and used it, was bound to pay for it, and that if the water was not pure and wholesome another remedy was provided. The defendant, in fact, has issued a writ against the Corporation for damages for injuries received by his nephew through being supplied with impure water. Judge Gye gave judgment for the defendant, holding that the Corporation was bound to supply water fit and proper for domestic purposes, including the purpose of drinking, and this it had not done.

We notice that the Great Central Railway Company are offering admirable and ample facilities to those desirous of spending Eastertide at places reached by their picturesque and comfortable route. Excursions are announced from London (Marylebone), suburban stations, Woolwich and Greenwich to all the principal towns and holiday resorts in the Midlands, North of England, North-east and North-west Coast watering places, Scotland and Ireland. On Wednesday, April 11, 16-days' tickets will be issued to Ireland. Special fast trains will leave Marylebone at convenient times for all parts on Thursday, April 12, and at midnight an additional express will be run from Marylebone and Harrow to the Midlands, Yorkshire and Lancashire. The information has been comprehensively and concisely tabulated in an A.B.C. programme showing all particulars at a glance. Copies can be obtained free at Marylebone station, or at any of the company's suburban stations, town offices or agencies.

Dr. C. Porter, medical officer of health at Johannesburg, in the course of an official report on the Chinese compound, states :—"Having had over ten years' intimate official experience of the housing of the labouring classes in England, as medical officer of health for the county of Shropshire and of the county borough of Stockport, and assistant medical officer for East Kent, I beg, in conclusion, to state that in my judgment the conditions under which the Chinese live in the compounds within the municipality of Johannesburg are, without any manner of doubt, very much superior as regards housing, food and payment to those which the unskilled labourer can command in either the manufacturing or rural districts of England, and also to those which are often considered good enough for our own soldiers."

The works committee of the Metropolitan Asylums Board have reported that the total cost of the High Wood school, exclusive of the site, had been 105,507*l.* 12*s.* 8*d.*, of which 91,911*l.* 10*s.* 2*d.* was for the buildings and works in connection therewith, including the making of roads and paths and the laying out of the grounds, 7,506*l.* 15*s.* 11*d.* for the equipment, 4,075*l.* 17*s.* 6*d.* for architects' charges, and the balance for landscape architects' and quantity surveyors' fees, clerks of works' wages, lithographing, &c. While the buildings were in course of erection extra works and variations to the net value of 2,909*l.* 4*s.* (to which must be added a sum of 1,000*l.* paid to the contractors in settlement of their claim of 4,270*l.*, "in respect of extra cost of work through delay of procedure by reason of the many alterations made") were sanctioned. The amount sanctioned by the Local Government Board in respect of the erection and equipment of the schools was 123,420*l.*, so that the actual expenditure incurred had been 17,912*l.* 7*s.* 4*d.* less than the estimated expenditure. High Wood school was designed for 360 children. The total cost of erecting, fitting up and furnishing the buildings, including the site (2,300*l.*), was just under 300*l.* per bed.

In a report submitted to the members of the City of London Union by the chairman of the assessment committee, attention is called to the fact that no fewer than 750 properties are situated in two parishes, leading to great inconveniences. It is further noted that the property of the City approximates in value to 200,000,000*l.* sterling. Urging the necessity of rearrangement, the report continues:—"Some simplification is essential if public efficiency is to be secured and unnecessary expense avoided. I would seriously urge the guardians to take this matter in hand without delay before it is forced upon the notice of the City by those who would not be so sympathetic in any scheme for reforming or remodelling the public service in the City. I speak guardedly upon this matter, as I cannot convey to this meeting the several reasons which lead me to remark upon this subject."

TRADE NOTES.

The Royal Victoria infirmary, Newcastle-on-Tyne, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues.

Messrs. Thomas Piggott & Co., Ltd., Atlas Works, Birmingham, have just secured an order for twenty-six of their patent pressed steel tanks 16 feet long by 12 feet wide by 8 feet deep for Argentine. This makes a total of sixty-five of these tanks ordered by the same company. They have also received an order for a rivetted steel self-supporting chimney, 5 feet 3 inches diameter at top by 9 feet diameter at base by 100 feet high, for a South Wales colliery.

THE PUTNEY HIPPODROME.

The foundation-stone of a new hippodrome for Putney was laid on Saturday last. Sir Henry Kimber, who was to have performed the ceremony, was prevented by illness from attending. His son, Mr. Henry Dixon Kimber, C.C., officiated, however, in his stead. In declaring the stone well and truly laid, the latter expressed a hope, in which he said he knew Sir Henry joined, that the building might have a long career of usefulness and uninterrupted success.

It is situated in Felsham Road, just off the High Street, Putney, and has a frontage of 110 feet to Felsham Road, a depth of 80 feet, while the height will be about 60 feet. The front will be of red brick and stone, with an ornamental tower rising to a height of nearly 80 feet at the right-hand corner. The house will accommodate 1,500 people and the cost is estimated at 23,000*l.* The exits will be ample and well arranged, being thirteen in all, so that the house can be emptied in a very few minutes.

The building is constructed on the cantilever principle, with no intermediate columns to obstruct the view. It will be entirely fireproof throughout. On both sides of the fireproof curtain the stairs, floors, tiers and every possible part will be fireproof, and fire hydrants will be fitted throughout. The stage is to be 49 feet long and 30 feet wide, and the proscenium opening 31 feet wide and 32 feet high.

The Hippodrome is completely isolated from the surrounding buildings by a footway 20 feet wide running around three sides, and it will be run on strictly temperance principles.

The architect is Mr. Frederic W. Hingston, of Portland House, Basinghall Street, and the builders Messrs. Kingerlee & Sons, of Oxford. Messrs. Dawnay & Sons are supplying the steelwork. The ventilating and heating will be by Messrs. Hendry & Pattisson, and the electric lighting by Messrs. Roger Dawson, Ltd.

ALDWYCH CRESCENT.

At last week's meeting of the London County Council questions were asked *apropos* of the offer by a syndicate, of which Mr. L. Wormser was secretary, for a lease at a rent of 55,000*l.* a year of the central portion of the crescent site formed in connection with the Holborn to Strand improvement, and concerning another offer by Mr. G. D. Perks on behalf of a second syndicate in respect of the site. The following account of the negotiations with the two syndicates has been given by the improvements committee:—

Preliminary negotiations were opened in March 1905

Digitized by Google

with the representatives of Mr. Wormser's syndicate for an option for a lease, and in August 1905 sketch plans were submitted showing the manner in which it was proposed to develop the site in the event of the Council agreeing to lease it to the syndicate, when it was stated that an option was no longer required but that a definite offer for a lease would be made. On December 12, 1905, Mr. G. D. Perks wrote on behalf of a second syndicate asking the Council to grant a six months' option of a lease, and on December 19 sketch plans were received. On January 30, 1906, Mr. Wormser made a definite offer for a lease and submitted full details as to the requirements of his syndicate in respect of peppercorn period, term of lease, licenses, &c. On February 8 Mr. Perks's syndicate was informed that as a definite offer for a lease had been made the Council would not be likely to entertain an offer only for an option. On February 13 Mr. Perks wrote stating that he had seen his clients and that "subject to the building agreement and plans being settled between them and other details which may arise, they would be prepared on the signing of the building agreement, to pay the sum of 55,000*l.* as one year's ground rent in advance." The Council will note that the terms of this offer are somewhat indefinite. Each syndicate, however, was informed that, although we were prepared to entertain its proposal favourably, we wished, before considering the matter further, to be satisfied as to its capability to carry out the conditions of the agreement which would have to be entered into. Mr. Wormser's syndicate on February 21 submitted the names, with bankers' references, of the firms who were prepared to underwrite practically the whole of the capital required. On February 26 Mr. Perks wrote stating that "assuming the scheme would cost a million sterling, they thought there would be no difficulty in finding half that amount, either in debentures or debenture stock, provided that the necessary margin was obtained by the French group subscribing and expending their 500,000*l.* in priority." Mr. Perks also suggested the terms of a letter which should be written to him with a view to its being used by the representative of his syndicate in Paris when completing the matter. Mr. Perks did not submit any references, and as our inquiries with regard to the underwriters in the case of Mr. Wormser's syndicate were satisfactory, we had before us two proposals—one from a syndicate submitting a definite offer with satisfactory references and with full details of its scheme, the other from a syndicate who had submitted no references, whose capital was apparently still to be arranged for, and whose offer could hardly be described as definite. So long as one of the offers was not accepted the Council was losing a possible rent of more than 1,000*l.* a week, and in these circumstances we had no hesitation in advising the Council to accept at once the offer made by Mr. Wormser's syndicate. On March 21, the day after the Council had agreed to our recommendation, Mr. Perks wrote stating that he had received a telegram from the representative of his syndicate in Paris suggesting a deposit of 56,000*l.*, and giving the names of references, but Mr. Perks in his letter made no definite offer.

The similarity of the two schemes suggested for developing the site appears to arise from the fact that the architects acting for the two syndicates were originally concerned in the preparation of a joint scheme. From information which has been placed before us, we consider that the architect acting for Mr. Wormser's syndicate was justified, owing to the arrangements which he had made with his former associate, in preparing his plans in the form in which they were submitted to us. Mr. Wormser is the secretary of the syndicate to whom the Council has agreed to lease the site, and his financial position is therefore not a matter which need be considered. On a careful review of the whole of the facts, we see no reason to advise the Council to depart from its decision to lease the site to the syndicate for whom Mr. Wormser is acting, and we are of opinion that not any of the other parties who have submitted proposals in respect of the site have reason to complain of the treatment which they have received.

HARBOUR EXIGENCY WORKS.

AT a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, April 2, Mr. Maurice Wilson, president, in the chair, a paper was read on "Harbour Exigency Works," by Mr. Frank Latham, borough engineer of Penzance

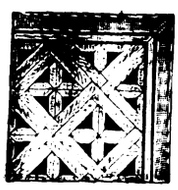
After describing the construction of the heavy swing-bridge at the Penzance Harbour, the author proceeded to deal with the works which were rendered necessary, owing to the unsafe condition of the retaining sea walls and defective foundation under the main structure. The weight of the bridge, when open, had caused the foundation to subside and the retaining walls to be thrust outwards, and there was a tendency for the structure to be let down sideways into the harbour. The opening and closing gear had become crippled and required immediate attention. The author then described the methods adopted by him in rectifying the collapsing structure, commencing from the taking down and rebuilding of walls and the strapping up of others, to the remedial measures adopted under and around the roller path and lifting gear. The manner in which the work was effected caused no interruption of the traffic over the bridge, and means were provided by which it could be opened and closed for passing vessels almost at any stage during the progress of the work.

He next described the design and construction of the wrought-iron dock gates at the 50-feet entrance to the floating dock. The gates consist of inside and outside skin plates built up on a framework of steel angle-iron, and strengthened by division stay plates which divide each gate up into several watertight compartments.

Each gate is calculated to weigh 50 tons. There is provision for partially overcoming the concussion of the waves and for neutralising the buoyancy of the gates during high water. Certain suggestions made by the late Mr. James Abernethy, which were adopted, are referred to. An unforeseen weakness revealed itself during a storm in 1900, and the gates suffered considerable damage, one gate becoming a total wreck. The author described the methods he adopted in beaching the water-logged gates, the various details of reconstruction and the features introduced, by which the defect was rectified. The work of reconstruction was one of great urgency, and was continued without cessation from start to finish. The work was subjected to hydraulic test previous to fixing.

The author then described the method adopted by him in exigency cramping. The masonry over the dock gates had commenced to lift through being severely shaken by shocks from the gales during storms. The masonry was expeditiously made secure by simple but effective cramping, thus averting further mishap.

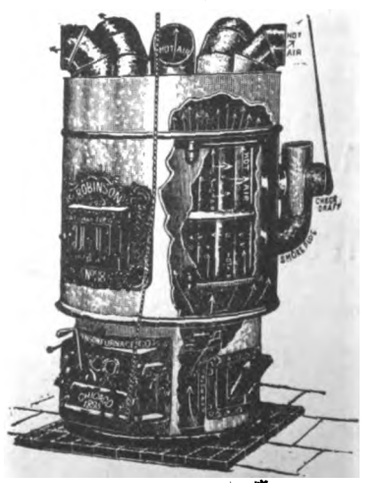
Mr. Latham then described an effective method adopted by him in reconstructing a length of harbour wall which had suffered considerable damage. The work was completed without interfering with the overhead traffic or disturbing the filling behind the wall, and the cost of the work was comparatively small. He further described the method adopted in removing and reconstructing a pier head in deep water, in which advantage was taken of the old wall to protect the new one, thereby saving the cost of a temporary dam, which constituted an interesting feature of the work.



The author finally dealt with the underpinning and otherwise securing of undermined and collapsing dock and harbour walls, introducing much interesting and useful information gathered from his personal inspection of works under his control in the diving dress under water.

ECONOMICAL CONCRETE CONSTRUCTION.

In a number of cases of recent designs for structures of concrete, with and without reinforcement, says the *Engineering Record*, the estimated cost of the work was so far below the tenders for it that considerable criticism was received by the designing engineers. In one case in particular, where the structure was decidedly attractive as a piece of design, the cost of executing it proved so great that it was impracticable and was given up for a different construction. These differences between estimates and bids were not due to any difficulty in the way of obtaining materials for the concrete, but to a failure to appreciate the expense of putting it in place.



In designing steelwork, one of the maxims for the guidance of the drafting-room is to employ duplicate pieces as much as possible. This is also a good rule in planning concrete, provided it results in using the same forms. The forms and not the finished concrete masses must be kept in mind in designing such work. An architect who recently congratulated himself on the saving in cost that would result from some thin concrete walls he had succeeded in introducing in the plans for a building, was much

disgusted to learn, on the receipt of the tenders, that the moulds for constructing them would be so expensive to frame and use that plain brick walls would be considerably more economical. It is difficult to appreciate fully without considerable experience the expense of constructing many of the concrete masses called for in engineering and architectural work. When concrete can be placed in large volumes its cost is low, but if it must be elevated several storeys and placed in small moulds filled with reinforcement rods its cost must inevitably be high. Moreover, if the columns, girders and walls require special forms which use up lumber so thoroughly that it has little subsequent value, this fact must also raise the cost of the finished work to a considerable degree.

Another factor to be considered in such work is the selection of proportions of ingredients which will give the desired strength and density with the minimum cost. This subject has been discussed so much that the really important fact of the whole matter is pretty well buried beneath the debates over details. This fact is the importance of the character of the sand, gravel or broken stone in any determination of proportions. In many localities there is very little possible choice of such materials, but it sometimes happens that a solution can be made between a number of varieties. When this is possible, the engineer has an opportunity to show judgment in determining the mixtures for different parts of the work. If a strong concrete is required, as Mr. L. C. Sabin points out in his excellent manual on "Cement and Concrete," rich mortar will not be able to make up a deficiency in the strength of the stone; but if a low strength is sufficient, and consequently a poor mortar is to be used, but little will be gained by having a very strong rock from which to obtain broken stone. In this case a rock that presents a good surface to which mortar may adhere is the principal requirement, and a very hard rock need not be insisted upon. It is for this reason that the customary specification requirements for 1:2:4, 1:3:5 or other proportions are inadequate. A number of engineers have abandoned such clauses and specify mortar mixtures only, leaving the amount of broken stone to be used for different parts of the work to the judgment of the resident engineer.

While it is probably true that the high cost of much of the concretework done to-day might be reduced by paying more attention to working conditions when plans are drawn, it is also apparent that there are certain features of construction methods that may be improved. A large proportion of the cost of concretework in buildings is for labour, and this labour charge is raised unnecessarily in some cases by a very natural tendency to have a large mixing plant for the whole work. The concrete turned out of such a plant must be wheeled and elevated, and it may be questioned whether a considerable reduction in labour charges could not be made in some cases by using small mixers driven by electric motors and capable of being moved readily from place to place. Materials could be delivered to these mixers regularly, and there would be no necessity of having a large number of men idle a considerable part of the time, as is often the case where the concrete is furnished from a central plant in wheelbarrows. It is possible to make connections with street wires in most cities, and contractors who have used electricity for power speak so favourably of it that the slowness with which electrically-driven mixers and other plant are introduced is rather surprising. In a large amount of concretework recently executed near New York there was practically no wheelbarrow transportation whatever except for the materials. The concrete was mixed very wet and discharged through troughs directly into place. The conditions were exceptionally favourable for such a method of construction, but anyone who saw the operations could not help being impressed by its advantages.

CORRESPONDENCE.

British Standard Specification for Portland Cement.

Sir,—In your issue of the 21st ult. you published a copy of a letter sent by Messrs. Charles Nelson & Co., Ltd., to the secretary of the Engineering Standards Committee on the above subject, making a complaint that the Rugby manufacturers have not been represented on that committee. The complaint of the undue preponderance of the Thames and Medway interests on the committee is doubtless a just one in theory, and I have no doubt that the publicity given to the matter in your Journal may cause it to be reconsidered, as the accession of a representative of the trade, outside the Thames and Medway districts, to the com-

Are you interested in WOOD PRESERVATION?

Apply to the **ANTHROL** Company, Kinning Park, Glasgow, and you will receive an interesting booklet on the subject, which gives a full account of the remarkable properties of **ANTHROL** and describes the very simple and inexpensive methods by which it is applied. It is an antiseptic preparation which protects any kind of wood impregnated with it from decay in both damp and dry situations, and from the ravages of all wood-destroying organisms in either temperate or tropical climates.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The ANTHROL COMPANY, Kinning Park, GLASGOW; and 6 Crosby Square, LONDON.

Digitized by Google

mittee—not necessarily a Rugby manufacturer, by the way—would provide a leavening which would be generally acceptable.

The remainder of the letter you publish is perhaps of more interest as a frank admission of a manufacturer of the limitations of what is generally known as Rugby Portland cement.

I cannot agree with Messrs. Nelson that clause 1 of the specification "is drawn up to cover cement manufactured from chalk and clay." The clause stipulates that cement "shall be prepared by intimately mixing together calcareous and argillaceous materials"—quite a different matter. There can be no cause of complaint on the question of calcium sulphate and water to regulate setting. The specification does not enforce their use, but limits it. If Rugby cement is made without these additions there can be no hardship to manufacturers.

In clause 6 complaint is made that the percentage of magnesia is limited to three, while in the same sentence the correspondent admits that Mr. Bertram Blount, who is on the committee, has wide experience of the quality and composition of cements manufactured from the lower lias formation. In the absence of evidence to the contrary, I think it should be conceded that the fixing of this limit had the approval of Mr. Blount, than whom perhaps no one in this country has had wider and more varied experience in matters affecting the composition of Portland cement of all kinds and manufacture.

The contention that the best Portland cement is made in any particular district cannot be maintained. The best cement is produced only by the most careful manufacture, and there is no difference between the best of the lias cements and the best of the cements manufactured in various parts of the country.

It is singular, however, to read that a quick-setting cement cannot be manufactured by Messrs. Nelson to comply with the very moderate demands of the British standard specification—viz. 400 lbs. tensile strain in seven days—but, of course, the members of the committee cannot be held responsible for this, and I am sure Messrs. Nelson would not wish for any preference over other manufacturers in this respect.

With regard to the Chatelier test, there is little doubt that this has proved perfectly satisfactory and reliable in practice, and is a test that has been freely adopted by makers and engineers, the former quite as much for their own help as to comply with their customers' requirements. It is not necessary, as Messrs. Nelson suggest, to keep down the tensile strength to enable cement to pass this test, as Portland cement of high tensile strain will, if properly made, pass the Chatelier test with ease. The lime need not be reduced if good mixing, burning and grinding are carried out.

It is true that the Chatelier test is not yet adopted by the German manufacturers, but it is officially used in France, and has been approved by a special committee of the International Society for Testing Materials. American specifications require a "boiling test" quite as exacting, though not quantitative, in its results. The merit of the Chatelier test is that it gives "figures" instead of "opinions," a very desirable improvement on old methods.

The British standard specification has worked remarkably smoothly from the time it was first published, and considering the many conflicting interests to be reconciled it has proved very practicable. It is a boon to manufacturers in disposing of many old and contradictory specifications, and, at the same time, its acceptance by cement consumers has been practically unanimous.

Although I know nothing of the working of the committee, there can be no doubt that in such an important matter as the formulating of a cement standard specification, the members, all of whom are well-known experts, have foreseen that some slight alteration of the specification may be considered necessary as soon as experience has been gained in its working.

The fact that such revision was deemed by the committee to be advisable is public knowledge, and in accordance therewith information as to some modification in the specification and further representation on the committee is naturally to be expected.—Yours faithfully,

The Saxon Portland Cement Co., Ltd.
A. C. Davis, Managing Director.

P.S.—I might add that some of the largest manufacturers inland know nothing of the suggested meeting of protest referred to in Messrs. Nelson's letter.

DOULTON'S "IGNIS" BATH HEATER
IN COPPER.

No. 1497.

Bath heaters are of the greatest benefit in a house even though there is a system of hot-water circulation. The use of gas for cooking, &c., through a great part of the year, saves the ordinary firing and thus stops the hot-water supply. In such cases a bath heater is most serviceable, as a hot bath can be had at any time, at a minimum cost and without any trouble.

To meet this special demand Messrs. Doulton have made a heater that is both cheap in price and lasting in wear.

All parts are made in stout hardened copper, tinned inside.

The water in no case comes into contact with the gas.

Ordinary burners are used for heating instead of Bunsen's or atmospheric.

Cold water is raised 55° in passing through the heater, but water of a higher temperature can be obtained if the quantity is reduced.

The flow of water should be regulated by a stop cock, so as to give the amount of water required and no more,

PRICES.

No. 1497. Polished copper heater to give 1½ gallons per minute £4 15 0
No. 1497A. Polished copper heater to give 2 gallons per minute 5 10 0

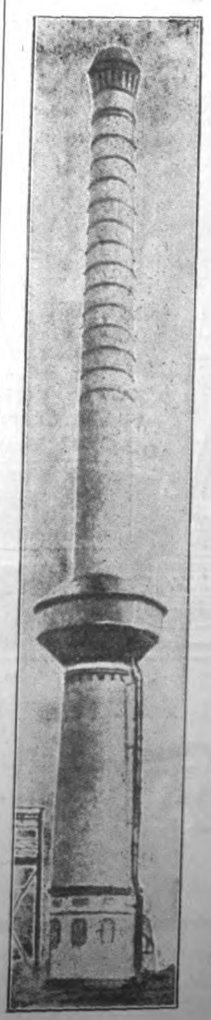
HALL'S Sanitary Washable DISTEMPER

The Real Sanitary Water Paint.



Hall's Distemper is the real Washable Distemper. It was one of the first invented, and is to-day better than ever, because the Manufacturers have, by reason of many years of scientific and practical tests, continually improved its manufacture until perfection has been attained.

Hall's Distemper is made in two qualities—the inside quality is specially for interior wall decoration, the outside quality being most suitable for all other purposes, both inside and out, whether on wood, stone, brickwork, or any kind of building material.

Its utility for Farm and Estate Buildings, such as dairy and tool-sheds, kennels, barns, shooting boxes, and temporary buildings of all sorts, is remarkable.

Full particulars of Hall's Distemper, in the form of a beautiful booklet, entitled "Modern Development in House Decoration," will be sent post free on application to the Sole Proprietors and Manufacturers,

ELECTRICAL ENGINEERS,
Head Office and Works. DENTON, MANCHESTER.

The ST. PANCRAS IRONWORK CO. LTD.

The accompanying illustration shows one of the switchboard galleries erected by The St. Pancras Ironwork Co., Ltd., at the City of Bradford Electricity Works. The floors consist of the St. Pancras Insulated Floor Lights, specially designed for use on Switchboard Galleries, for which purpose they have been adopted with great success on many important stations under leading engineers. The iron framework, which is very strong, is completely insulated by the glass lenses, which are of special shape with a chequered surface to give good foothold, while the joints between are caulked with a patent hard, fire, water, and electricity-proof composition, thus forming a complete glazed and insulated floor.

Extensive modern plant and special resources enable the St. Pancras Ironwork Co., Ltd., to carry out every description of

LIGHT IRONWORK

with accuracy, despatch and economy. Architects and Engineers' designs faithfully executed.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

Mr. T. H. Fleeming, architect to the committee, 10 Queen Square, Wolverhampton.

THE foundation-stone of the buildings of the Selby waterworks, to be erected at Brayton Barff, about two miles from Selby, has been laid. The estimated cost of the undertaking is 30,000*l.* The new works comprise an engine-house, boiler-house, coal depôt and workshop, the former being 30 feet by 30 feet in dimensions. The buildings are to be of red brick with stone facings, having two towers, under which are the pumps and bore-holes, the latter being 400 feet in depth. The pumps, engine and boilers are to be duplicated, and the engines will be capable of pumping three-quarters of a million gallons of water per day. The reservoir covers a site of about an acre, with a holding capacity of 800,000 gallons of water, and is 150 feet above the level at Selby. The water will be conveyed to Selby by gravitation. The scheme is being engineered by Mr. Percy Griffith, M.Inst.C.E., of London, and Mr. Bruce Gray, A.M.Inst.C.E., surveyor to the Selby Urban District Council.

"Standard" One-Piece Lavatories are eminently desirable for bedrooms and dressing chambers as well as bathrooms. Their beauty of pattern and chaste design—fitting harmoniously to any scheme of decoration; their pure-white, non-porous surface, and freedom from joints where dust and dirt can lodge, render them far more sanitary than old-fashioned washstands.

TRADE Standard MARK

Write for our special lavatory booklet, showing many beautiful new patterns, free on request. Also our elaborate catalogue "MODERN BATHROOMS," showing many model interiors with approximate costs in detail.

TRADE NOTES.

MESSRS. DOVE BROTHERS have obtained the contract for the Methodist church house, Westminster.

MESSRS. J. PARKINSON & SONS, LTD., Blackpool, have been awarded the contracts for the erection of a head post office in Springfield Street, Warrington. The building will cost 16,000*l.*, including the fittings but excluding the site, which was bought from the Corporation some years ago.

THE Bradford Town Council on the 4th inst. accepted various tenders for builders' work in the extension of the town hall (second section). The masonry contract was let to Mr. J. T. Wright, Leeds, whose tender was for between 28,000*l.* and 30,000*l.* Mr. F. E. P. Edwards, Brewery Street, Bradford, is the city architect.

WE understand that the Pulsometer Engineering Company, Ltd., of Reading, have on order, in addition to many other plants for various trades, the following "Criton" water-softeners for gasworks, namely:—A 3,000 gallons per hour plant for the South Metropolitan Gas Company, East Greenwich, and a similar sized plant for the Ipswich Gas Company.

THE Fireproof Company, Ltd., 10 York Buildings, Adelphi, W.C., has been favoured with the order by the Anglo-Egyptian Bank for the complete installation of fireproof cells and archives, all to be constructed with their dovetail corrugated steel sheeting, &c. The company has also a large quantity of work in hand, amongst which might be mentioned the Grand Hotel, Eastbourne; saw mills, Malta, for the Admiralty; new prison cells for H.M. Prison Commissioners, &c.

MESSRS. THOMAS CRAPPER & CO., LTD., sanitary engineers to His Majesty the King and His Royal Highness the Prince of Wales, have acquired for the purpose of building new premises a most conveniently situated and suitable site in the Fulham main road, Chelsea, S.W., about one minute's walk from Marlborough Road, in which their present works are situated. The new premises will comprise works, warehouses, show-rooms and offices.

VARIETIES.

THE Council of the British Medical Association have decided to rebuild its offices in London at a cost of about 40,000*l.* Since the Association bought its present premises in Agar Street and the Strand the membership has greatly increased.

THE streets and buildings committee of Edinburgh Town Council recommend that Mr. James Sim, depute city road surveyor, be appointed surveyor, in room of Mr. D. C. Proudfoot. The salary of the new surveyor was fixed at 450*l.*, and the office will be advertised.

MR. P. C. COWAN, chief engineering inspector to the Local Government Board, has held an inquiry at Newtownards, Ireland, with reference to the application of the Urban District Council for a loan of 18,500*l.* for the purpose of providing a water supply to the town.

MAJOR J. STEWART, R.E., a Local Government Board inspector, has held an inquiry at the County Hall, Wakefield, relative to an application of the West Riding County Council for permission to borrow 93,800*l.* for the erection of acute blocks, &c., in connection with the Storthes Hall Lunatic Asylum.

THE Manchester gas committee on the 6th inst. granted for the first time an application for the supply of gas for manufacturing purposes at a cheaper rate than that supplied to ordinary users. It was resolved to supply it experimentally for a period of twelve months at 2*s.* per thousand cubic feet. That is 3*d.* less than the usual rate.

THE Urban District Council of Greetland at their last meeting accepted the tender of Messrs. Drinkwater & Schofield, of Greetland, amounting to 3,508*l.*, for the construction of the new bacteriological sewage tanks and percolating filters, in accordance with the scheme prepared by Messrs. Berrington, Son & Martin, of Westminster and Wolverhampton.

THE committee of the Carnarvon National Eisteddfod have accepted an offer of a prize of 25 guineas by the mayor (Mr. W. A. Darbishire) for an essay in Welsh on slate quarrying, with reference to, among other things, workmen's compensation and the effect of foreign importation on the slate trade of this country.

DESIGN FOR ELIZABETHAN HALL MANTELPIECE.

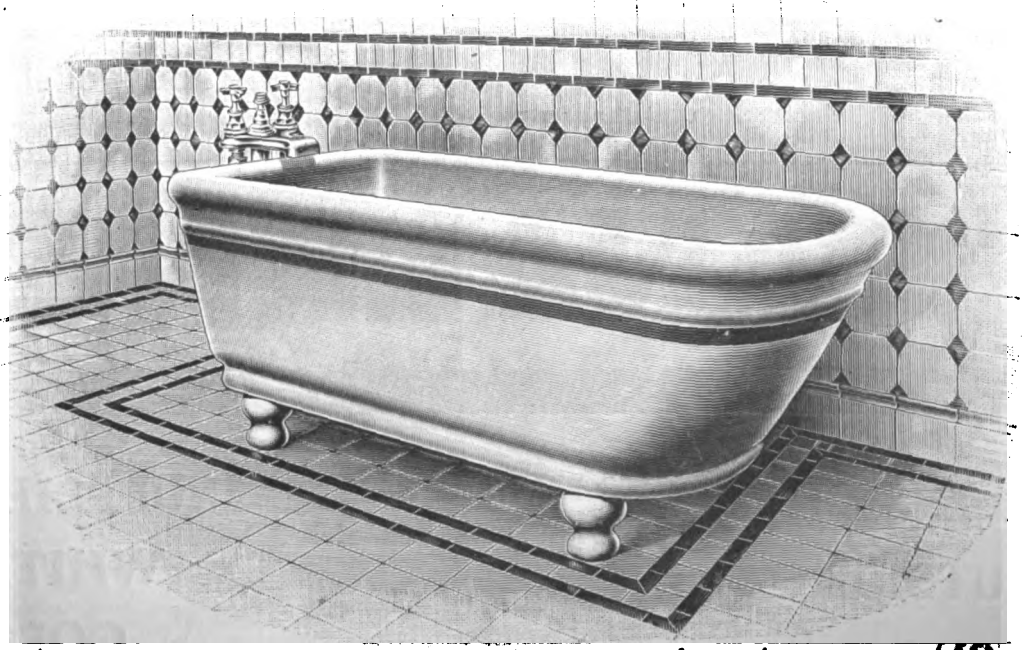
A REALISATION OF BACON'S IDEAL MANSION.

THE late Mr. Joseph Aird, proprietor of the Wellington Tube Works, Great Bridge, Staffordshire, who died in March, has, amongst other bequests, given 500*l.* each to Mr. Charles Bill, Mr. George Tonks, Mr. S. Rushton and Mr. Nock, employés of his firm, and the residue of his property to his nephew, John Aird the younger, absolutely.

THE Pocklington Rural District Council received 141 applications for the post of surveyor and inspector of nuisances. Three names were selected. Two of the candidates had each a previous experience of eleven years. The third, who was finally elected, is a farmer. The councillors considered that testimonials as to professional ability were the reverse of a recommendation.

MR. JUEB, clerk to the Herne Bay Urban District Council and secretary to the National Sea Defence Conference, has received a letter from the Prime Minister stating that the suggestion that a representative of the Conference should be appointed on the Royal Commission which is to deal with the question of sea encroachment will receive consideration, and has been referred to the President of the Board of Trade.

THE question of the sub-committee's recommendation in regard to the hydrants, as the outcome of the water-flea scare, came before the plans and works committee of Edinburgh Town Council last week. It was agreed to recommend that all the ball hydrants in the city should be replaced by valve hydrants at once. It is expected that the work of substitution will be completed within six months. The cost will be about 8,000*l.* or 9,000*l.*



THE death is announced of Frederick Tallmadge Towne, younger son of Henry R. Towne, and general superintendent of the Yale & Towne Manufacturing Company, which came suddenly at his home in Stamford, Conn., at the early age of thirty-four. His education was such as to thoroughly fit him to conduct the company's large manufacturing plant. His consideration for his employés had much to do with the *esprit de corps* which prevailed at the works.

THE Hull City Council have been informed that the Local Government Board had presented a report to Parliament stating that the Corporation's proposal for carrying out the scheme for a new wharf pier, &c., known as the Western Reservation Scheme, at an estimated cost of 250,000*l.*, was outside the scope of the duties of municipal corporations. The Board also pointed out that the rapid increase of the municipal debt and the many calls on the local authorities were reasons which rendered it inexpedient as a general rule to give power to raise money to be applied for such powers.

THE April report of the United Operative Plumbers Association shows some improvement in the state of trade. The number of members out of work is less than last month or in the same month last year. It is intimated that at Aberdeen the members have received six months' notice, to expire on September 1, 1906, of a desire on the employers' part to alter the working hours; and that they have sent in a counter-notice of a request for an advance of wages and alterations of the by-laws.

THE three great German industrial associations—the Central Union of German Manufacturers, the League of German Industries, and the Central Bureau—have combined for the preparation of commercial treaties. By uniting these associations, which comprise almost every leading manufacturing, mining, shipping, transportation and industrial concern in Germany into one body, which henceforth will move and work under one single direction, a strong impetus and powerful influence, it is felt, will be given to the trade interests of Germany.

THE Westminster City Council have decided that application be made to the London County Council for sanction to borrow the sum of 95,000*l.* for the acquisition of the freehold of the Grosvenor Canal and the adjoining land belonging to the Grosvenor estate, for the provision of wharves, plant and equipment for the collection, removal and disposal of house and street refuse. It was pointed out that the land had been purchased from the Duke of Westminster on very generous terms; the price proposed was about one-third that would have had to be paid if the land had been acquired by compulsory purchase.

AT a Local Government Board inquiry held at Newcastle on Monday into an application by the Corporation for sanction to borrow 7,665*l.* for street improvement works, the Inspector said that the Board would not sanction the loan if the Corporation employed the regular staff on the work. He did not know why, but it was their rule. If special men were employed for the purpose the loan might be granted, but they would not let the Corporation use their own men for the purpose. The city engineer said in that case they would engage men specially. The Inspector said the rule had something to do with the keeping of the books.

THE Glasgow Corporation have received a deputation representing the Operative Bricklayers' Society, which complained that builders who undertook stonework and other sections of a building put stonemasons to do bricklayers' work. They considered that if work were to be done efficiently it should be done by the tradesmen in connection with the particular trades. They asked the Corporation to insert a clause in their contracts to that effect. The mere handy man should not be put to do the work of tradesmen when there were tradesmen in abundance walking the streets. The matter is to receive consideration.

THE Central Markets committee of the Court of Common Council submitted to the last meeting a report with reference to the condition of the iron superstructure beneath the Central Meat and Provision Markets at Smithfield, and recommended that a thorough examination of the same should be made at a cost of 300 guineas. The Chairman of the committee said that with the accident at Charing Cross railway station before them it was necessary that a thorough examination should be made of the ironwork, which should also be thoroughly tested, as it had not been done for some years. The subject was referred to the Coal and Corn and Finance committee.

Mr. A. HUDSON, on the 4th inst., sat at St. Mary's Hall, Coventry, to arbitrate in a dispute between the Coventry Master Builders' Association and the carpenters and joiners. The former had given notice to the latter of a proposed alteration of rules regarding overtime. The practice hitherto has been for time and a quarter pay to be made for labour done after the ordinary working hours, but this payment having, according to the employers, only been given in other branches of the trade after eight o'clock, the masters sought to bring the carpenters and joiners into line with other departments. On their part the carpenters and joiners put in notices demanding an advance of wages from 8¾*d.* to 9½*d.* per hour.

THE Liverpool and Birkenhead district committee of the General Union of Operative Carpenters and Joiners sent to the Right Hon. Sir H. Campbell-Bannerman the following letter with regard to the Trades Disputes Bill :—"Dear Sir,—At a conference held this afternoon we have been instructed by a unanimous vote to forward to you the following resolution :—'That this conference of representatives of the General Union Society of Operative Carpenters and Joiners from Lancashire, Cheshire and Shropshire views with indignation the third clause (law of agency) as proposed in the Government Bill, and strongly urge upon the Government the redrafting of the clause so as to ensure the principle of immunity for trade union funds.'"

MR. CHARLES JOHN GALLARD, of Tunbridge Wells, retired builder, who died on January 8, aged fifty-five, left estate valued at 39,464*l.* gross and at 7,146*l.* net. Subject to the interest of his wife, he left the ultimate residue of his estate in trust to apply such part thereof as shall be necessary for the purchase of land at Southborough, near Tunbridge Wells, and to build thereon almshouses to be known as the "C. J. Gallard Almshouses" for four married couples, eight unmarried men and eight unmarried women, the cost of the erection not to exceed 5,000*l.* The remainder of his estate is to be held in trust for the maintenance and keeping in repair of the almshouses. Each married couple will receive 20s. per week, each unmarried man 15s. per week and each unmarried woman 12s. per week.

The Garrick Theatre is one of the most comfortable theatres in this country. You can enjoy your seat in the spacious stalls without the annoyance of rising after every act to permit your neighbours to pass to and fro. Added to this, when you are able to see a play which from beginning to end is excellent, a pleasant evening is assured. "Brother Officers," the piece which has been running under the able management of Mr. Arthur Bourchier, is one of those enjoyable plays which the keenest critic and the strongest opponent of theatres might listen to with pleasure. The whole is admirably played and artistically produced, and from rise to fall of curtain the attention of the audience is fully taken up, and at the close there is a feeling of an evening well spent, and almost a sensation of regret that the play is over and that it is time to once more wend the homeward way.

Mr. Lewis Waller at the Imperial Theatre has just produced "Brigadier Gerard." The play is written round the time of Napoleon's 1814 campaign. Mr. A. E. George gives a good impersonification of the Emperor. It is difficult when all are good to signal out anyone in particular, but Mr. Lewis Waller as Captain Gerard, the principal part, is delightful, the whole of his acting from commencement to finish showing the work of the finished artist. As to the grace and charm of Miss Evelyn Millard, those who have seen her play before can well imagine the pleasure to be derived from her performance as the Comtesse de Roquelaure. Early in May Mr. Lewis Waller, with the co-operation of Mr. H. B. Irving, announces his intention of producing "Othello," and lovers of Shakespeare should not miss this opportunity of seeing possibly the most interesting of Shakespearean plays.

ELECTRIC NOTES.

The cleaning and lighting committee of the Edinburgh Town Council recommend that 120 additional arc electric lamps be erected in streets to be selected, and to replace the remaining flat-flamed burners by 2½ feet incandescent gas burners. The capital cost of conversion is to be spread over three years, and the whole work will be undertaken before next winter.

An action of importance to municipalities in relation to their powers to enter into competition with private traders in connection with their various municipal undertakings has been entered by a private citizen against the Sheffield Corporation. For some time past strong representations have been made by tradesmen interested in electric-light installations against what they term the unfair competition of the electric-light department of the Corporation. This has culminated in an action in the Chancery Division of the High Court by the Attorney-General, at the instance of Mr. Albert Davidson, claiming a declaration that the Corporation had no power to carry on the business of wiring consumers' houses and premises, or of supplying or fixing electric fittings in houses or other buildings, or to sell motors outside the city of Sheffield, or to expend in such trades or businesses any capital moneys borrowed for the purposes of their electric-light undertaking, or the receipts of such undertaking. The Corporation have decided to defend the action.

NEW CATALOGUES.

The catalogues of the Carron Company are invariably interesting. From the position of the Company a great variety of products is always available, and care is exercised over every detail. In the catalogue of baths and sanitary appliances, fifty varieties are shown, and each has something to distinguish it. There are also different sizes for most of them. The material adopted is the finest quality of Carron iron, and defects are therefore not likely to arise. The enamelling is another specialty of the firm, and there are some metallic enamel baths which are at a cheap price. The colours are adapted to circumstances, and decoration can be employed. The waste trap can be fixed in any position, thus facilitating the making of plumbers' connections. Particular attention is given to packing, and if one should become damaged or broken it is not to be accepted. Bath-room and lavatory fittings of many kinds are also shown.

Climatic conditions have compelled the people of the United States to give greater attention to heating than is usual in England or in Northern Europe. There is a

continuous demand for improvements, and, indeed, domestic engineers find it profitable to concentrate their attention on furnaces. The Robinson furnaces have been known since 1879, and during a quarter of a century improvement has

been added to improvement. The Robinson Furnace Company, of which the headquarters are in Chicago, are not content with one specialty. They manufacture furnaces for warm air and for hot water, heating furnaces in which gas can be used, and others which can be served with wood alone. There are also heaters for water and air, and fittings by which the furnaces can be adapted to all conditions. In the tubular furnaces the flues being of small diameter can be numerous, and, as the outer shell is formed as a steel radiator, the heat is proportionately conserved. Care is taken to have the furnace dust-tight as well as gas-tight. They are arranged to suit different requirements, such as from 5 to 7, 9 to 11, 11 to 13, and 13 to 16 ordinary rooms, and also for churches, stores and halls up to 15,000, 22,000, 35,000, 50,000 and 75,000 cubic feet. The prices vary proportionately. The numerous testimonials are evidence of the efficiency of the furnaces. One clergyman writes:—"During the cold weather of January '97, the house throughout was as comfortable as in summer. Indeed, had I pressed the furnace I could have had the house, even in the coldest days of January, too warm for comfort. I cannot speak in too high praise concerning the heating capacity nor of the economical advantages over all other furnaces. The water pan is also a perfect success in giving a mild and moist atmosphere. Many have asked my opinion of the furnace, therefore I give it in this way unsolicited." Besides the furnaces there are several other ingenious auxiliaries which extend their utility, such as the "Eclipse water-heater," wall-piping, foot-pieces, stack-heads, register-boxes, air-dampers, all of which denote the completeness of the provisions of the Robinson Furnace Company to meet all difficulties which may arise in heating.

The *Stampa* says it is reported from authoritative sources that the ex-Queen Natalie intends to present all her Servian properties, valued at 3,000,000*l.*, to Servia, for the erection of an imposing cathedral with the proceeds, on condition that her late husband, King Milan, and her son, King Alexander, are interred in it.

The Local Government Board have given their sanction to the application of the City Council for permission to borrow 28,500*l.* for the completion of the purchase of Warley woods and park. The inquiry was held on the 3rd inst. The city will be provided with an undivided park of 109 acres. The total cost is 43,000*l.*, and incidental expenses raise the amount to 43,247*l.* The total land to be acquired, including the Lightwoods Park, is 134 acres, and it is estimated to be worth 70,000*l.*

CORRESPONDENCE.

British Standard Specification for Portland Cement.

Sir,—In your issue of April 6 you publish a letter from the Saxon Portland Cement Company commenting on our letter which you kindly inserted in your issue of March 21. We might point out that there are, or any way ought to be, limitations in the composition, setting time and uses of all good Portland cements, and that although your correspondent refers to "what is generally known as Rugby cement," our letter represented the opinions of many manufacturers in different parts of the kingdom.

In clause 6 we only ask on what authority (otherwise, from what experience) are the limits put at the particular figure stated in the specification. We did not say that the best Portland cement was made in the Rugby or any other district. The proof of the pudding is in the eating, and in Portland cement a record of more than fifty years should give where the best cements are to be obtained.

In clause 10 we certainly do not say we are unable to manufacture a quick-setting cement which will not comply with a 400 lbs. tensile strain at seven days, we simply state our ordinary cement is slow setting, but to order we can make a quick-setting cement to comply with the specification.

As to the Le Chatelier test, we maintain that it condemns not only an inferior cement but often a good one, that is, a cement much above the average manufacture. As we live we learn, and your correspondent may find that what he calls his good cement (if good enough) will fail at this test.

As to the standard generally, we and many others are desirous of raising it to keep out the cheap foreign cements. If your correspondent had written to us we should have been pleased to have given him full particulars and objects of the meeting, and in our covering letter to you we stated this.

Some years ago there was an Association of Inland and North of England Manufacturers, and these we communicated with; other cement makers interested, who commenced the manufacture of Portland cement later or with whom we were unacquainted, were not approached, but through your paper were offered full information on application.

We are not aware of any large inland manufacturers excepting your correspondent and the Norman Cement Company, which we understand trades under the same name, who have set up as makers of Portland cement.

We might say that the manufacturers attending the meeting will represent works from Scotland, East, West and Midlands of England (including Cambridge), and also Thames and Medway.—Yours truly,

April 9, 1906. Chas. Nelson & Co., Ltd.

WHITGIFT GRAMMAR SCHOOL EXTENSION.

With the view to the educational necessities of the present day, the governors of the Whitgift Foundation at Croydon have caused to be carried out an important extension of the Grammar School buildings, which have just been completed under the direction of and according to the design of Mr. George Berney, architect, who is himself an old Whitgiftian, and who has made the new structure harmonise as far as possible with the architecture of the old buildings.

The new erections, by means of which the teaching accommodation is increased to sixteen classrooms besides science laboratories, lecture-rooms, drawing school and workshops, are in red brick and Portland stone, and the total cost, including the heating, electrical work and all fittings, amounts to 17,500*l.*

The general contractor was Mr. E. J. Saunders, of Croydon, and Mr. Thomas Tidy was the clerk of works. The heating installation was carried out by Mr. T. J. Drake; the brasswork and ironmongery throughout was supplied by Messrs. Hill & Smith; the upper floors were constructed by the Columbian Fireproofing Company, Ltd., of King William Street, E.C.; the staircase was made by the Victoria Patent Stone Company; the sanitary appliances were supplied by Messrs. Doulton, of Lambeth; the carving to the external stonework was executed by Messrs. Daymond & Son; the glass roofs of the lanterns were provided and fixed by Messrs. Heywood & Co.; the glazed bricks were supplied by the Farnley Iron Company, of Leeds; the asphalte work was laid down by Messrs. Falds; and the wood-block flooring was fixed by the Acme Flooring Company. The scentless oil on the floors ("Florigene"), it may be added, was supplied by the Dust-Allayer Company.

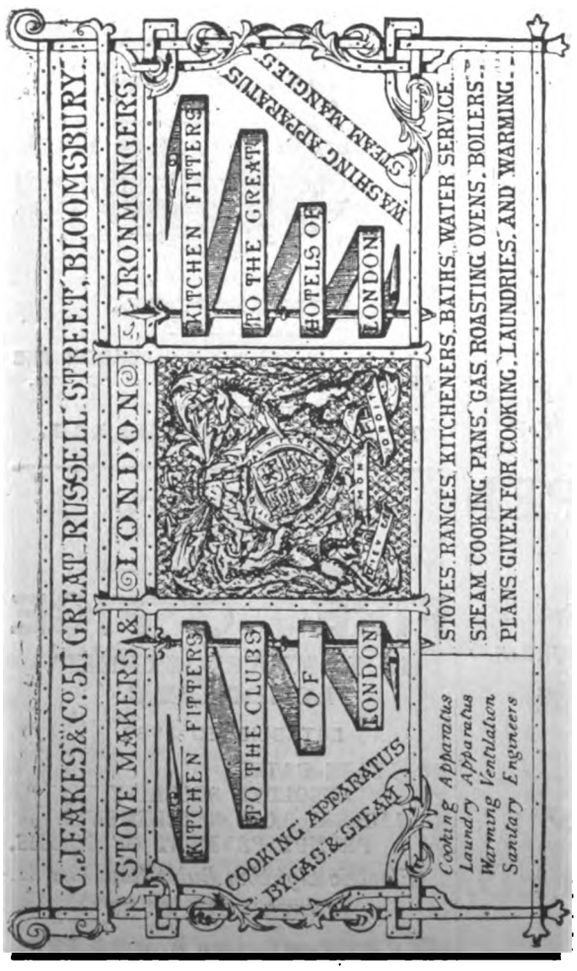
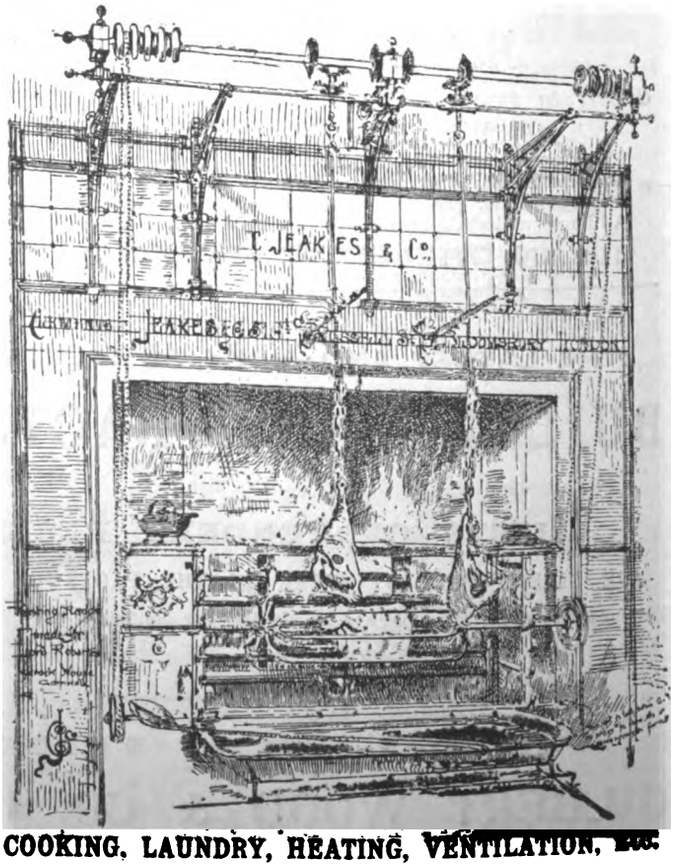
THE BOROUGH POLYTECHNIC INSTITUTE.

An exhibition of students' work was held at the Borough Polytechnic Institute on Saturday last, when an opportunity was afforded to a large number of visitors of inspecting the well-equipped art rooms, laboratories, drawing offices, workshops and gymnasia, as well as abundant specimens of the excellent work done by the students, who number over 2,000.



In view of the attention now being paid to what is taking place on the Continent and in the United States, in the direction of the industrial training for the youth of both sexes and for apprentices, and of the increasing interest now taken in the subject, it is opined that many will be glad to learn more of the work of an Institute which, since its opening in 1892, has made a special feature of industrial training combined with sound educational work. To further the work of the Institute, it may be mentioned that there are practically six advisory committees, the members of which are mostly employers, and others connected with the industries for which instruction is given.

The list of departments numbers fourteen in all, and among these are special trade classes for engineers, metal-plate workers, bricklayers, carpenters, plumbers, wheelwrights, &c. In the engineering and building trades department instruction is afforded in practical geometry, machine construction, applied mechanics, steam, practical mathematics, building construction, architectural drawing, motor-car designing and construction. The chemistry, as well as the physics and electro-technical departments are also very important ones, and ample evidence is afforded that the instruction given—which is to supplement the training of the factory or workshop, and not to supersede it—is of a very sound and thorough character, reflecting much credit on Mr. C. T. Millis, M.I.M.E., the principal, and the large staff of efficient teachers under him, as well as the other officials.



HOVE CARRIAGEWAYS.

The Hove borough surveyor (Mr. H. H. Scott) has prepared a report and submitted it to the works committee of the Hove Town Council as to the relative cost of the different kinds of material used for maintenance of the carriageways in the borough. From this it appears, say the *Sussex Daily News*, that there are 34·28 miles of public highway in the borough, and the area of the carriageways is 573,153 super yards. Of this length 1·20 miles are paved with wood, 2·57 macadamised with granite, 3·51 macadamised with quartzite, and 27·00 macadamised with flints. The quantity of materials used for repairing the roads for the year ending March 31, 1905, was 2,291 tons granite, 2,347 tons quartzite, 2,207 cubic yards surface-picked flints, and 2,125 yards dug flints. The cost of maintenance of the carriageways for the year ending March 31, 1905—not including the repayment of loans for wood-paving—was 8,256*l.* 9*s.* 6*d.*, made up as follows:—Western Road and Church Road (wood-paving), 15*l.* 17*s.* 10*d.* per annum, or 0·16*d.* per yard super for one year; Shoreham Road (partly granite, quartzite and flints), 2,375*l.* 15*s.* 7*d.* per annum, or 9·20*d.* per yard super for one year; Church Road (macadamised part), 214*l.* 4*s.* 1*d.* per annum, or 12·87*d.* per yard super for one year; New Church Road (granite macadam), 682*l.* 10*s.* 5*d.* per annum, or 6·76*d.* per yard super for one year; other roads of which no separate account is kept, 4,968*l.* 1*s.* 7*d.* per annum, or 2·60*d.* per yard super for one year; total cost, 8,256*l.* 9*s.* 6*d.* for one year. The cost of repairing the different kinds of roads, including scarifying and rolling, was:—Roads made with Guernsey granite, 8·27*d.* per yard super; quartzite stone, 7·82*d.* per yard super; surface flints, 6·88*d.* per yard super; dug flints, 5·04*d.* per yard super. The wood pavements which have been laid have cost:—In Church Road, opposite the Town Hall (1896), 11*s.* 2½*d.* per yard super; Western Road (1898), 11*s.* 8½*d.* per yard super; Church Road, except opposite the Town Hall (1901), 14*s.* 7½*d.* per yard super; George Street (1903), 14*s.* 2¾*d.* per yard super; Church Road, west of George Street (1905), 11*s.* 1½*d.* per yard super.

Within the last few years the use of the quartzite stone on roads formerly made with surface flints has been considerably extended and, in the surveyor's opinion, with very great advantage; in fact, he thinks it is doubtful if surface-picked flints are worth their present price. Quartzite stone might with advantage be used in all streets where surface flints are now used, those streets of least traffic being repaired with dug flint. For light pleasure

COOKING, LAUNDRY, HEATING, VENTILATION, &c.

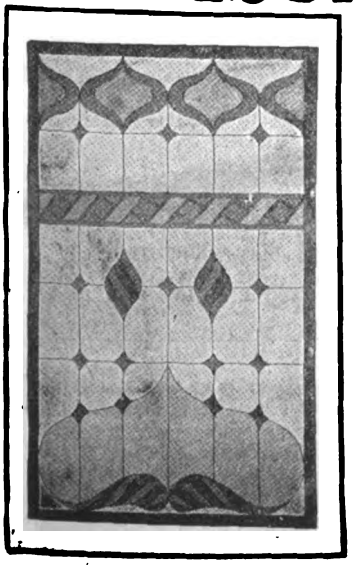
Digitized by Google

traffic flints made an excellent road, easy and pleasant to drive over, but such roads were very dusty in dry weather and were not suitable for heavy traffic. Recently tarred macadam had been adopted for carriageways to a considerable extent, and it doubtless had many advantages over ordinary macadam, such as imperviousness to moisture, less noise, less dust and the ease with which it could be cleansed. Basalt, flints, granite, Hartshill stone, limestone, ragstone, whinstone and furnace slag had been used for tar macadam in different towns with more or less success, but in his opinion the most suitable materials were limestone, ragstone and furnace slag. Success depended much upon the making of the materials; it must also be laid in dry weather, and ought not to be laid in cold weather.

For carriageways tarred macadam was usually laid about 4 inches in thickness, the bottom layer being about $2\frac{1}{2}$ inches in thickness, and composed of stones broken to a $2\frac{1}{2}$-inch gauge. This coating was rolled with a roller of medium weight, and ought to lie exposed to the air at least two days before the second layer was applied. The second layer was made with finer material, about $1\frac{1}{2}$-inch gauge, spread $1\frac{1}{2}$ inches in thickness and again rolled. When the whole had been laid and rolled a dusting of fine stone or slag was spread over the surface. Tarred macadam had a decided advantage over ordinary macadam for motor traffic. The rubber tyres sucked up from an ordinary road the fine particles which bound the larger stones together, with the result that the surface became disintegrated, and in addition to which an abnormal quantity of dust was produced in dry weather. He did not consider, however, that tarred macadam would be suitable for use in streets where ordinary macadam was not suitable. The cost of laying tarred macadam, including the necessary excavation of an existing carriageway, was about 4*s.* 6*d.* per yard superficial, and if it was thought desirable to make a trial of the material, he would suggest New Church Road as being a suitable road. Calculated at 4*s.* 6*d.* per yard super, the portion between Sackville Road and Aymer Road, a length of 290 feet, would cost 284*l.*

The committee have resolved that a trial be made with tarred macadam in Sackville Road northward from Blatchington Road for a distance of 300 feet, and that proposals be invited for supplying and laying the same.

MIXED PAINTS.



The manufacture of paint and of varnish as special industries is, says Mr. G. B. Heckel in the *Engineers' Record*, a comparatively recent development. Within less than a century painters ground their dry colours in oil with slab and muller, and either "cut" shellac in alcohol in a churn or boiled up gums and solvents in a pot over the kitchen fire. It was the physical impossibility of meeting in this way the demand of a rapidly growing population of wooden-house builders that led to the establishment of paint and varnish factories. At first only white lead and colours were ground in oil and supplied in paste form to painters, who combined them with the necessary thinners in the shop. But custom is a tyrant yielding only to force, and up to fifty years ago there were still old painters who bought and "mulled" their own colours.

The second step towards specialisation was the Yankee invention of ready-mixed paint, about the middle of the last century. The formula was patented by the inventor, and in some sections of the country all ready-mixed paints are still popularly known as "patent paint," though they bear no resemblance to the original patented article, and none of them are now patented. The step was perfectly logical: if white lead ground in oil by machinery and pigments ground in oil by machinery are better and cheaper than the same materials ground by hand in the paint shop, why wouldn't it be better and cheaper to leave the whole process of paint making and mixing to the paint factory? Hence the modern paint factory and the modern ready-mixed paint. And they have come to stay. According to Dr. Toch, who has carefully compiled the statistics of the subject, the annual consumption of ready-mixed paints "increased from zero in 1860 to something like 30,000,000 gallons in 1903." In comparison with such figures, the increase in the consumption of lead in oil during the same period is not worth considering.

Painters as a class are opposed to ready-mixed paints, partly because they have been educated to the use of another form of paint, partly because the workman is always conservative, and partly because painters believe—wrongly, of course—that shop mixing is profitable, whereas

it is a self-evident fact that hand labour can never compete, either in cost or efficiency, against machine labour; it is the old case of the "grain cradle" against the reaper and binder, the hand-loom against the power-loom, the planing mill against the carpenter's plane, the sewing machine against the thread and needle. The whole history of human progress is filled with illustrative incidents, showing that increased facilities of production and decreased cost always lead to increased consumption, and a consequent increase of demand for labour. The sewing machine, to take but one instance, has increased the demand for needlework so that ten, yes, a hundred seamstresses are now healthily employed where one found precarious and unwholesome occupation before the days of Elias Howe.

So it will be with ready-mixed paint—in fact, is already so. Before 1860 paint was something of a luxury; to-day an unpainted building in the more progressive parts of the country is exceptional and "sticks up like a sore thumb." It will become rarer and rarer as property owners come more and more to realise the fact that it is cheaper to use paint than to save it. The statement sounds like a paradox, but it is bare truth. Unpainted wood or metal will decay, while the regular, judicious use of good paint will preserve wood or metal indefinitely. It is cheaper and safer for a property owner to neglect his fire insurance than to neglect painting, because while few buildings burn all buildings decay unless protected with paint.

That fact being self-evident, the choice of paint becomes the important consideration, and here we are led inevitably back to ready-mixed paint as the logical up-to-date conclusion.

The case seems to me so clear and simple as to be scarcely worth arguing about. On the one hand, we have white lead, &c., ground to a thick paste in linseed oil and tinting colours of various kinds (pure or impure), also ground to a thick paste. These the painter must mix with a paddle in a paint bucket with large quantities of linseed oil, turpentine and liquid dryers. Whatever his skill or patience he cannot in this way produce a uniform mixture. This fact can be proved at any time by taking a few drops of such a mixture on a ground-glass slab and rubbing it with a muller. The tint will gradually deepen, proving that the colouring matter was not thoroughly incorporated; and if the colouring matter, which we can distinguish, is not evenly distributed, neither are the other ingredients which we cannot distinguish. Moreover, the painter is more likely than not to get adulterated oil and turpentine and cheap resin dryers. He does not know, the dealer does not know, but those who study paints know that this condition is at the root of more than half the complaints of poor painting.

On the other hand we have ready-mixed paints, prepared by machinery in a paint factory equipped for analysis and testing. The paint manufacturer's living depends on his ability to give the best satisfaction at the lowest cost. It is a matter of experience that the manufacturer in any line who fails to "make good" does not last. If a paint manufacturer's business grows steadily, there can be only one reason for it, and that is that his paint is good and that old jobs are bringing new customers.

Mixed paints differ considerably in composition and yet the higher grades of them are surprisingly alike in general results. They are based chiefly on certain proportions of white lead and oxide of zinc, &c., some with additions of "sublimed" lead or "zinc lead" and with or without inert materials. The painter is chiefly exercised over these inert materials (gypsum, barytes, &c.), ignoring the fact that the "good old lead" of the past generation was three-fourths of it loaded with these same "inert materials." He also overlooks the fact that the largest consumers of paint in the world, railroad companies, agricultural implement makers, &c., who specify exactly the components and proportions of their paints, have unanimously settled on combinations in which these inert materials play a conspicuous part.

As far as the consumer is concerned, if he does not make the "penny-wise-and-pound-foolish" mistake of trying to save money on the cost of his paint, he is perfectly safe in buying and using any high-grade ready-mixed paint in the market, bearing the brand of a reputable manufacturer.

But it is far better and more economical to use any paint than to use no paint or to use paint too infrequently, and this, it strikes the writer, is a field where the press of the country have it in their power to do a great economic service in the way of education.

SOUTH AFRICAN HARBOURS.

At the ordinary meeting of the Institution of Civil Engineers on Tuesday, April 3, at 8 p.m., Sir Alexander R. Binnie, president, in the chair, the paper read was "The Harbours of South Africa; with special reference to the Causes and Treatment of Sand-bars," by Mr. C. W. Methven. The following is an abstract of the paper:—

The paper begins with a short description of the littoral of South Africa from Capetown to Delagoa Bay. The author points out the remarkable absence of deep-water indentations forming natural harbours between these points, and gives some reasons for this. Reference is also made to the formation of some of the lakes and lagoons, and the gradual elevation of the coast-belt as affecting the present physical condition of the coast.

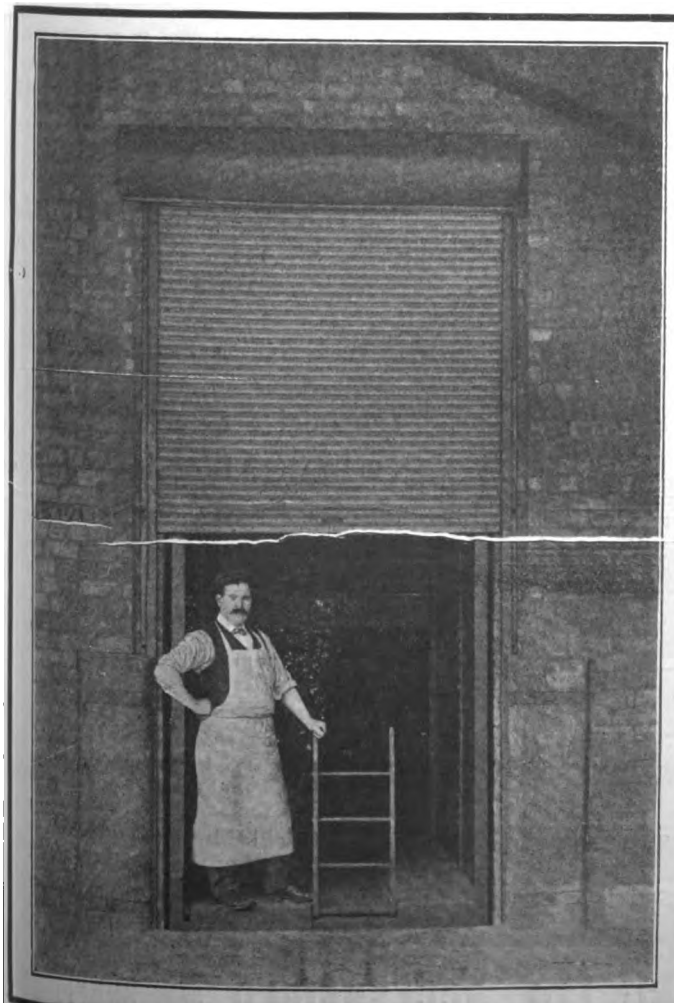
A brief description of Table Bay harbour is given, and the works of dock extension proposed by the author and Mr. Hammersley Heenan, general manager and engineer to the Cape Harbour Board, estimated to cost 3,561,757*l.*, are referred to. Statistics are also given showing the increase in customs revenue, imports and exports.

The embayments on the south-east littoral as far as Algoa Bay are next dealt with, with brief references as to their suitability for the construction of harbours. The author describes the main features of Algoa Bay and the remarkable strides which have been made in its commercial prosperity, in spite of the landing difficulties due to its exposed position and the want of adequate sheltering works. A short description of the existing jetties is given, and reference is made to the two important schemes now under consideration—one to project two great breakwaters into the bay in front of the town of Port Elizabeth, so as to form an enclosed harbour of some 800 acres, and the other to open up the Zwartkops river, which runs into Algoa Bay about 5½ miles to the northward.

The author next discusses the various causes to which may be attributed the formation of bars at the mouths of the rivers and lagoons on the south-east African coast, and the variations of their form, which take place in accordance with the physical features of the rivers and lagoons concerned, and of the coast-line in proximity to their outlets.

The treatment of lagoons is also discussed, with a description of their physical features and the causes of their formation, as well as of that of the sand spits separating them from the ocean. Illustrative reference is made to the lagoons at Durban, Umhlatuzi and St. Lucia, in Natal and Zululand.

River harbours are next dealt with, including Port Alfred, East London, Port St. John, Durban and Delagoa Bay.



After a short historical sketch of the engineering works carried out at Port Alfred and their results, the author describes the works proposed by him to reopen the river by the construction of a new outlet. In the description of East London harbour special reference is made to the successful application of sand-pump dredging to the bar in the open sea.

A full account is given of Durban and its lagoon, and of some of the natural causes which have operated in its formation. Short statistics are given showing the increase in the port's commercial prosperity between 1846 and 1904. A detailed description is given of the original condition of the bar at the mouth of the lagoon, and of the changes which occurred in its form at different periods in the progress of the works. Special reference is made to the important operations of dredging on the bar in the open sea, and the results which have been attained.

TRANSMISSION OF COAL GAS.

A paper was read on March 28 before the Society of Arts by Mr. A. J. Martin, C.E., on "Coal Conservation, Power Transmission and Smoke Prevention." Afterwards the chairman, the Hon. Richard C. Parsons, said:—

Speaking generally, the question of prevention of smoke in London was of very great importance to every individual, but it remained to be seen whether Britishers were as far advanced as they ought to be in giving up the pleasures of their open fireplaces. He had no doubt that those present sat down after dinner in front of the fire to warm their toes, and every now and then to poke the fire.

But in doing so they never thought what was taking place in the chimney-pot, which emitted every time the fire was poked a vast amount of smoke and many blacks. In order to avoid making black fogs in London it was necessary, in the first place, to give up open fireplaces, which, if they were modified to some extent, would reduce the amount of smoke they produced; but any alteration in them would not altogether get rid of the smoke-producing properties they possessed. There was no doubt that in order to clear the atmosphere of London the adoption of gas-fuel was an absolute necessity, but it was a question whether gas could be burnt in such a way in gas-stoves as to give the heating power required at a reasonable cost. The author had thrown out some most valuable suggestions in regard to the supply of cheap gas, which he thought could compete with coal burnt in open fireplaces. He had no doubt that the considerable amount of heat which went up chimneys at the present time could be reduced by the adoption of stoves burning coal gas. His own office was unbearably cold before he adopted a stove, but it was now comfortably warmed by the combustion of the same amount of coal which he previously burnt in an open fireplace. He also adopted a stove in his house which warmed the whole house and burnt less coal than the open fires previously used. But by the adoption of coal-burning stoves the atmosphere of London would not be cleared, and if that was to be done gas-stoves placed in rooms must be adapted in such a way that the largest amount of heat was taken out of the gas and transmitted into the air of the room, economising the gas, and thus not incurring an excessive cost in using that form of fuel. The question immediately under discussion was whether the gas should be produced at the coalfields or in the vicinity of London at a price to meet the requirements. If it was produced in the vicinity of London there was no reason why the atmosphere of London should be blackened, because, owing to legislation, the combustion of coal was now so perfect with mechanical stokers that it was very rare for black smoke to be seen at the top of chimneys. Indeed it was only due to carelessness if smoke was allowed to come out of the chimney of a factory if a proper mechanical stoker was used. Coal gas, owing to the adoption of mantles, could now be produced more economically, because, as had been explained by the author, the adoption of oil for the purpose of increasing the illuminating power of the gas was now not so important as it used to be before the mantle was adopted and they used their "grandmothers' burners." It was, however, a difficult question to decide whether coal gas could be compressed to a pressure of 500 lbs. per square inch and transmitted economically in a pipe line to London, because a large portion of the gas, being hydrogen, found its way through the very smallest leakages in the pipes. They had found that to be the case in America, where the pressure did not go above 300 lbs. per square inch, and it had been necessary to surround the pipe line with another pipe, so that the leakage would be caught and pumped back into the gas mains. The gas in America was natural gas, and had been used by the Americans in the most prodigal manner. The leakage in the main had also been very considerable, and it was a very moot question whether gas could be transmitted in the manner suggested by the author. Nevertheless, the principle on which Mr. Martin had been working was in a measure not upset by that difficulty, because gas could be produced in the neighbourhood of London and transmitted for the purposes required. Up to the present time legislation had gone a long way towards reducing the amount of smoke emitted, and besides reducing the smoke emitted by factories both the District Railway and the Metropolitan Railway had been electrified, and the smoke produced by the railways, which was formerly perfectly unbearable, had now been entirely done away with. Up to the present, however, there had been no legislation with reference to domestic smoke. It was at the present time necessary, in order to obtain the assistance of the law, to prove a nuisance, and that was practically impossible with regard to smoke emitted by private houses. The County Council seemed to have gone into the matter very carefully, and the annual report of the officer of the Public Control Department of the Council in September 1904 stated, amongst other things:—"The public control committee will shortly have the whole question of domestic smoke under consideration in order to see whether measures can usefully be taken." That distinctly showed that the County Council was considering the matter, and he sincerely hoped they would carry their consideration further, and that the suggestions made by the author would receive consideration.

GOOD ADVICE.

Architects, Contractors, and others are recommended to journey by the

GREAT CENTRAL RAILWAY.

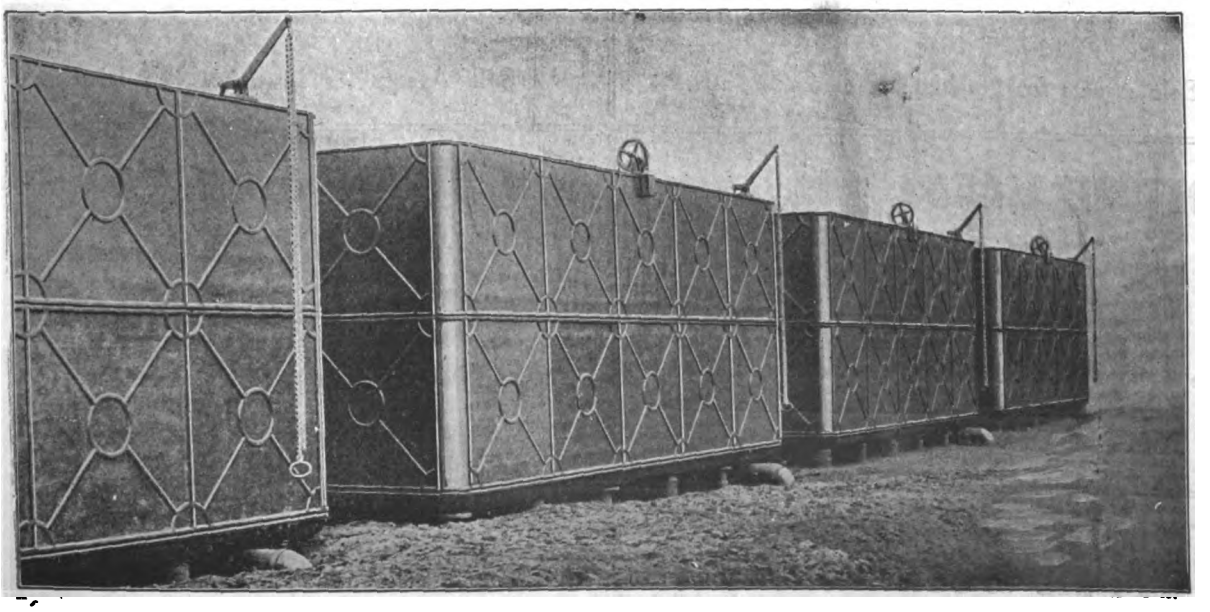
They will find it

RAPID TRAVEL IN LUXURY.

Each Express is VESTIBULED and has a BUFFET CAR attached available for FIRST and THIRD-CLASS PASSENGERS.

The London Express Trains centre on Sheffield, branching therefrom westward to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool; northward to Huddersfield, Halifax, Bradford, Leeds and York; eastward to Doncaster, Grimsby, Hull and North Lincolnshire.

Cross Country Expresses and Through Arrangements with other Companies are a distinct feature of the Great Central services. Liverpool, Manchester, and Sheffield are linked up by corridor trains with Lincoln, Harwich, Lowestoft, Norwich, and the Great Eastern system.



Newcastle, Sunderland, Durham, York, Bradford, Huddersfield, Rotherham and Sheffield are provided with through trains *via* Nottingham, Leicester, Banbury and Oxford, to and from Southampton, Bournemouth and the South-Western Line.

Bath, Bristol, Exeter, Torquay, Kingswear, Plymouth, and the Cornish Riviera are reached by Express Trains from Leeds, Wakefield, Halifax, Huddersfield, Sheffield, Nottingham, and Leicester.

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. off ordinary fares.

LARGEST MAKERS OF CAST-IRON TANKS

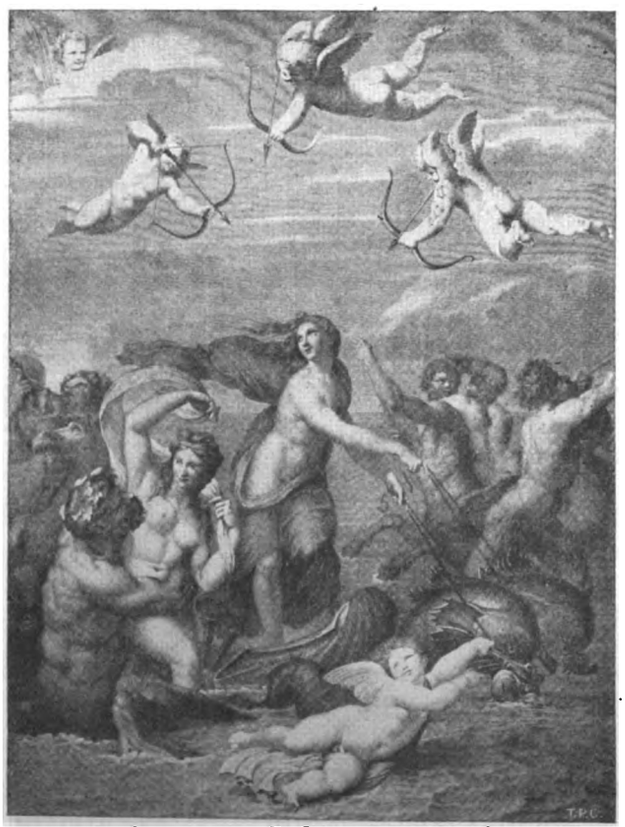
Art Plates from "The Architect."

AWARDED GOLD MEDALS, INTERNATIONAL HEALTH EXHIBITION AND ARCHITECTURAL AND BUILDING TRADES EXHIBITION (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for framing.



***The Corn Field.*—(1) Ploughing; (2) Harrowing; (3) Mowing; (4) Carting; (5) The Products of the Corn Field.**

In Five Separate Plates. Total Length, 14 ft. 7 in. by 15 in. deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT," in 1886. A few proofs were taken which immediately became out of print.

OPINIONS OF THE PRESS.—"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition has been issued."—*The Lady's Pictorial.* "They are beautifully done in colours by the permanent ink-photo process and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage.* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour work in permanent ink photo by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic and would grace the walls of any house."—*The Gentlewoman.* AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates they have been reproduced by Subscription at Half a Guinea the Set, free by post, carefully packed inside patent roller, and are now ready for issuing. Immediate application is requested. May be had framed in Black Reeded Frame with Gold Mounts, price Three Guineas the Set of Five Pieces.

Galatea.

From the Painting by RAPHAEL in the Villa Farnesina, Rome. Size 30 in. by 22 in. Price Two Shillings. Free by post, carefully packed inside patent roller.

St. George.

From the Painting by RAPHAEL, in the Louvre. Size 15 in. by 20 in. Price One Shilling and Sixpence. Free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

Publisher, P. A. GILBERT WOOD, Imperial Buildings, Ludgate Circus, London, E.C. (*FULL LISTS ON APPLICATION.*)

THE GLORIES OF NORTHERN FRANCE:
HER CATHEDRALS AND CHURCHES.
By T. FRANCIS BUMPUS.
A New Edition,
With Additional Chapters on ROUEN, MANTES, PARIS, and MEAUX,
and
110 Fine Illustrations from Photographs.

Some Press Opinions of the "Glories of France."

"Mr. Bumpus's descriptions are animated and accurate, and his explorations cover a large portion of France from Lille down to Angouleme. The illustrations, which are numerous, add greatly to the interest and value of his volume. He has visited, moreover, innumerable spots which the busy traveller is compelled to neglect."—THE ATHENÆUM.

"Mr. Bumpus writes with such enthusiasm, with such happiness and real enjoyment, that he carries his audience along with him, and makes reading almost as great a pleasure as travelling itself. From the spire at Bernieres, 'the work as of an angel architect,' to the umbrella of the abbess of Moulins, 'a downright useful alpaca affair, tied round the middle with a piece of string,' there is nothing that he does not enjoy."—TIMES.

"The work of an enthusiast and whole-hearted admirer of the buildings of the Middle Age. It is refreshing to be accompanied by a traveller so devoted to his subject and so whole-hearted in his expressions of praise."—DAILY NEWS.

"The style of the book is appropriately clear and definite, and the author's adoration of the Gothic glories that enchant him lead him into occasional bursts of emotionally eloquent praise."—GLOBE.

"Mr. Bumpus manages to convey not a little of his enthusiasm to the reader by his style of writing, and what he cannot do the excellent photographic illustrations—of which there are no fewer than 110—will assuredly achieve. If we could all take our rambles, armed with the knowledge, and inspired by the purpose which marks Mr. Bumpus's pilgrimages, how much more profitable our holidays might be than they usually are."—BOOKSELLER AND PUBLISHER.

"The author's easy style, his pleasant irrelevancies, and his discursive chatterings about the various places he saw, all help to make up a delightful book."—WESTERN MORNING NEWS.

"Records of summer holidays which are enough to make envious many tourists who come back bored after a trip on the Continent. . . . Besides architecture, Mr. Bumpus was able to discover much else to captivate his attention. He notices the musical services with the enthusiasm of an expert who is not confined to one style, and follows the order of Church services with more than a mere layman's interest. . . . It is impossible to mention a page of the book which is not interesting. The author endeavoured to make himself at home in the towns he visited, and there is no trace of that superciliousness which is to be found in many narratives of travel in France."—ARCHITECT.

"All American lovers of church architecture, or of solemn worship, ought to acquaint themselves with 'The Glories of France.' Mr. Bumpus's work is specially notable, in that he treats such churches as Chartres, Le Mans, and Troyes as not only the relics of a dead past, but also the shrines of a living devotion. The kneeling figures on the floor, the procession advancing along the aisle, interest him, as well as the flamboyant porch and the purpled window. This book ought to be in every library worth the name in the United States. The present expression of good-will is offered by me to Mr. Bumpus without any preceding request from him or from anyone."
RICHARD H. THORNTON,
Law Professor in the University of Oregon.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS

AN EXPLANATION.—The Luxfer Prism is a flat-backed prism, and is the best for Daylighting dark interiors. The absurdity of any claim to the contrary can easily be demonstrated. Prisms with corrugated backs were patented by the Luxfer Company in 1897, and discarded in favour of a more perfect invention, viz. The Luxfer Prisms, that have been sold in this country during the past six years.

The British Luxfer Prism Synd., Ltd., 16 Hill St., Finsbury, E.C.

The Denbighshire joint committee at their last meeting had a discussion arising out of the report of the architect and county surveyor (Mr. Wiles) respecting the county buildings to be erected at Colwyn Bay at a cost of 7,000*l.*, respecting the authority of the County Council and the standing joint committee in reference to the tenders. Several members expressed the opinion that it was the duty of the standing joint committee to open the tenders and accept one. The clerk said the question had never been really settled definitely, but in the past they had acted, in these matters, on a give-and-take line. Eventually it was resolved that at the next meeting of the committee the clerk present a list of all the tenders amounting to 300*l.* and upwards for the last five years, and the name of the authority accepting them, and if counsel's opinion has already been taken on the point in dispute, that it be presented with the return.

VARIETIES.

Mr. R. Hillier has been appointed clerk of works at the General Post Office West, St. Martin's-le-Grand, in succession to the late Mr. J. B. Clark.

The electors of Shrewsbury have passed a statutory vote in favour of the Church Pulverbatch water supply scheme, which is estimated to cost, with the gathering grounds, about 180,000*l.*

A new bridge is to be erected over the river Witham at Langrick Ferry, at the joint expense of the Holland and Lindsey County Councils and other public bodies in Lincolnshire. The total cost is 8,500*l.*

The Portsmouth higher education committee received 103 applications in answer to their advertisement for a clerk of works in connection with the construction of a secondary school for girls.

A motor-car to cost not more than 600*l.* is to be provided by the Derbyshire County Council for the use of their surveyor. The car is to be of British make. There are 600 miles of road in the county.

The Chelsea Borough Council have received a communication from the London County Council sanctioning their application for a loan of 22,500*l.* for the extension of the town hall in the King's Road.

A public inquiry with reference to the application by the Bromley Borough Council to the Local Government Board for sanction to borrow the sum of 19,259*l.* for the erection of new municipal buildings, court-house, &c., was held at the municipal offices, by Mr. F. H. Tulloch.

No less than 219 applications have been received for the vacant post of borough surveyor of Grantham. The number has been reduced to five, and a final selection will be made next week. Some of the applications come from the Malay States and Siam.

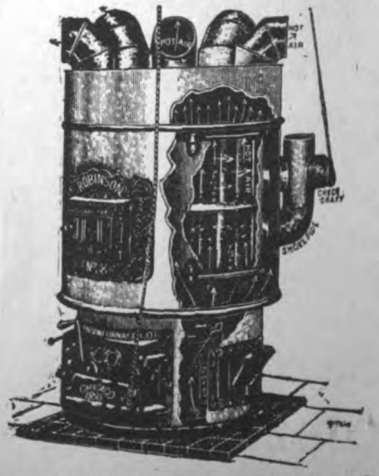
The Board of Trade "Labour Gazette" issued on Tuesday states that the building trades continued to show a general seasonal improvement during March, which was especially marked in the case of painters. Compared with a year ago, however, employment showed little change.

The Hyde Town Council were informed last week that for the first time since the borough sewage works were constructed, in 1892, the Mersey and Irwell joint committees inspector's report showed the effluent to be "satisfactory."

The Wandsworth Borough Council have accepted the offer of the mayor (Mr. A. Glegg) to erect a clock tower at Clapham Cross. The tower of Aberdeen granite and Portland stone will be 25 feet high, and the clock will have four dials, which will be illuminated at night.

The Amalgamated Society of Engineers state in their monthly report that the membership now exceeds 100,000. This is the first time that the membership of a single trade union has reached six figures. The number of the unemployed is 2,432.

The plans committee of Aberdeen Town Council on the 12th inst. sanctioned seventeen sets of plans, involving a total outlay of 16,300*l.* These included the scheme for the extension of the slaughter-house in Hutcheon Street, which will cost about 6,000*l.*



At the London Bankruptcy Court a slate merchant of Willesden, against whom a receiving order was made on the petition of a slate quarry company, passed his public examination. He attributed his failure to the fact of wood and iron mantelpieces having come into fashion as against slate and marble ones, which constituted the whole of his business.

The Carlisle Town Council have been informed that the new waterworks at Geltsdale would be so far completed by the second week in July as to enable the Corporation to turn the water into the city and discontinue the existing supply, which is obtained from the river Eden and conveyed by pumping to the householders. The estimated cost of the supply is 250,000*l.*

The Hungerford District Council were summoned at Hungerford at the instance of the Thames Conservancy for polluting the river Kennet, a tributary of the Thames, by allowing sewage matter to flow into it. The Conservancy first served the Council with a notice to stop the flow ten

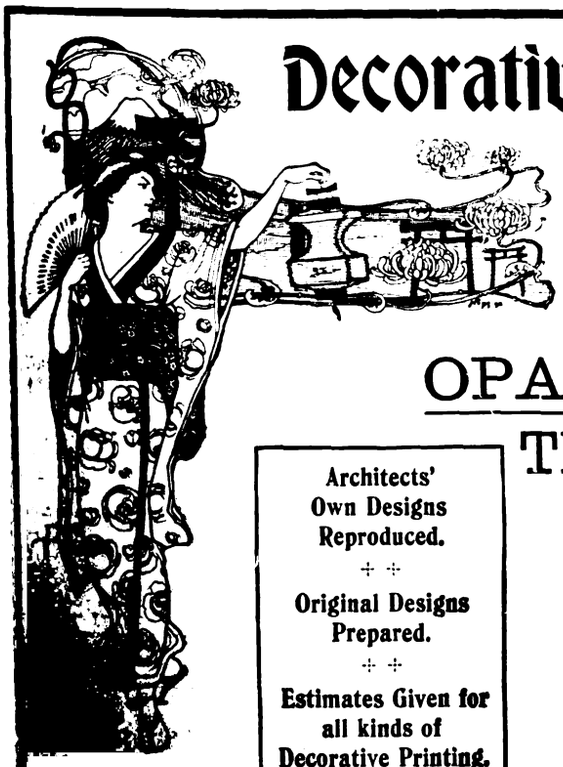
years ago, but nothing has yet been done. A fine of 50*l.* was imposed.

At Nelson, Lancashire, Colonel Durnford held an inquiry into an application by the Corporation to borrow 3,500*l.* for purposes of laying down brick-making plant at the refuse destructor. It was explained that bricks were to be made from clinkers. Nelson, it was said, is the first authority in the county to establish the system. Furnaces are also to be erected to extract solder from waste metal.

The asylum erected at Naburn by the York Corporation at a cost of 130,000*l.* has been opened. The asylum will accommodate 362 patients, but is so designed that, should necessity arise, it could be extended to accommodate 124 more cases. The extreme length of the building from north-east to south-west is about 740 feet, and the depth from north to south 430 feet. Messrs. Longden & Son were the principal contractors. Mr. Alfred, the city surveyor, prepared the plans.

At Long Eaton, near Nottingham, a large factory adjoins the cemetery. It is alleged that 230 employés have had their eyesight seriously injured through the "blinking" light caused by branches of the trees waving in the wind. The question of cutting down the trees was raised in 1898 and a poll of the ratepayers taken, when an overwhelming majority were in favour of the trees being left alone. Two years later the same matter was again discussed and the Urban District Council have now once again raised the question.

Mr. A. Hudson has published his award in connection with the dispute between the Coventry Master Builders' Association and the operative joiners and carpenters as to rates of payment. The masters proposed to change the payment of "time and a quarter" after a certain hour, with the object of bringing joiners and carpenters into line with other employés. The workmen affected asked for an increase of from 8¾*d.* to 9½*d.* per hour. The award of Mr. Hudson is to the effect that 9*d.* per hour shall be paid the workmen and "time and a quarter" abolished.



Over ten thousand tons of refuse have been destroyed by the Eccles refuse destructor during the year, an average of twenty-nine tons per day. About one-third of the refuse was turned into clinker and sold at 2*s.* 6*d.* per ton, realising 433*l.* The tins and old bottles weighed 250 tons. The tins are collected by the Central Hall Mission, Manchester, and over six thousand bottles were sold to the bottle exchange at one penny per dozen. The destructor furnaces have generated all the steam required for pumping and saved over 300*l.* in coal.

At Westminster Police Court on Saturday four men were before Mr. Curtis Bennett for final examination on a charge of breaking into 32 Kennington Oval, an unoccupied house, with intent to steal. A police sergeant said that there had been forty or fifty cases in South London of automatic meter robberies and of breaking into unoccupied houses to strip lead and metal fittings. In some instances immense damage had been done, places being swamped with water through cut pipes. The prisoners were believed to be the ringleaders. Each was sentenced to three months' hard labour.

The Manchester baths and washhouses committee have considered a letter from the Local Government Board on the question of the proposed baths at Bradford (Manchester). In this letter the Local Government Board gives sanction for the borrowing of 39,715*l.*, but considers that the amount proposed to be expended on these baths and washhouses appears to be very large, having regard to the population of the district which the buildings are primarily intended to serve. Suggestions are given as to how the plans might be modified. The city architect in his report holds that the scheme could not be satisfactorily curtailed.

A scheme is under consideration for the construction of a reservoir at Llanfihangel-glynmyfyr, between Ruthin and Cerrigydruidion, in Denbighshire, for the purpose of supplying water to the town and district of Wolverhampton, about 75 miles distant. It is proposed that a huge embankment should be constructed across the valley of the river Alwen, a tributary of the Dee. The impounding of the water will submerge the church, the church schools, an inn and several farmsteads. The water of the Afon Brenig, as well as that of the Alwen, will feed the reservoir, and the whole of it comes from upland country, ranging from 1,000 feet to 2,000 feet above sea-level.

with respect to new streets and buildings be repealed, and in substitution thereof the following be adopted, namely :—Every person who shall lay out a new street which shall not exceed 600 feet in length shall so lay out the same that the width thereof shall be 36 feet at the least. The carriage way of every new street which does not exceed 40 feet in width shall be 22 feet wide. The carriage way of every new street exceeding 40 feet wide and not exceeding 50 feet wide shall be 24 feet wide at least, and the carriage way of every new street which shall exceed 50 feet in width shall be 30 feet wide at least.

THE annual report on the Dartford Rural District has been issued by Dr. Richmond, the medical officer, who states that the sanitary conditions are satisfactory. The doctor commends the cottages of the old-fashioned type, many being of wood, saying that the latter kind are very suitable for agricultural places, as they are weather-tight, warm and comfortable, and what was most essential, the rents were moderate. As a rule they were not overcrowded. The brick-built cottage was too costly, had a sitting-room which was rarely used and only two bedrooms for the parents and children of both sexes. The doctor considered that the by-laws should require that every new house or cottage should have at least three bedrooms. He noticed that the brick-built cottages were in rows and badly built.

SIR H. CAMPBELL-BANNERMAN was asked in Parliament whether, considering the fact that no great international exhibition had been held in London since 1862, and that the present generation had had no opportunity of seeing such an exhibition, and that the previous two exhibitions had both been financially successful, he would be prepared to advise the Government to support a proposal to hold such an exhibition in the year 1908, provided a suitable committee was formed to go into the question. In the reply doubts were expressed as to the desirability of any such exhibition. If this can be proved the matter may be considered.

AT Armagh, a Local Government Board inquiry, conducted by Mr. Cowan, has been concluded, having reference to the application of the Urban Council for the sanction of a loan of 15,000*l.* for the carrying out of an improvement scheme under the Housing of the Working Classes Acts. The scheme of the Council includes the demolition of a number of houses in Banbrook Hill, and the erection of artisan dwellings on the site. The opposition contended that if the Council had enforced the powers vested in them under the Public Health Act more than sufficient sanitary houses could be procured; also that there was no need for the erection of houses, as there was a large number of vacant dwellings about Armagh.

THE Singer sewing machine factory at Kilbowie, N.B., is to have the second largest clock in the world. The only larger clock will be that on the Philadelphia city hall, the diameter of which is about 30 feet. Singer's, when completed, will be 26 feet in diameter. This is to be accomplished, not by enlarging the present face, but by taking away the large letters "The Singer Manufacturing Company," which now surround the top of the clock, and putting them on the outside circle instead. The new minute hand will be 13 feet in length, as against the 7 feet 6 inches of the present hand, and the hour hand will be proportionately lengthened from its present 4 feet 8 inches. Five tons of iron will be used in the construction of each of the four dials—20 tons in all—while these four dials will absorb 2,704 square feet of glass.

THE second transporter bridge in this country is under construction at Newport, Monmouthshire, and is to be opened in June. The first of the kind is across the Mersey, between Runcorn and Widnes. The Newport bridge, which is similar to those in operation at Rouen and Bilbao, spans the Usk and provides a crossing considerably lower down the river than the old stone bridge, which is necessary in view of the development of the east side of the river. Across the river, at a height of 170 feet above high-water mark, is a girder held by cables, on which a trolly is to be drawn by electric motors. Suspended from this trolly by thirty steel ropes is to be a car, 40 feet by 30 feet, divided into three sections—two outside for pedestrians and the middle portion for vehicles. Altogether the car will accommodate 200 passengers and six vehicles. The crossing will occupy about one minute.

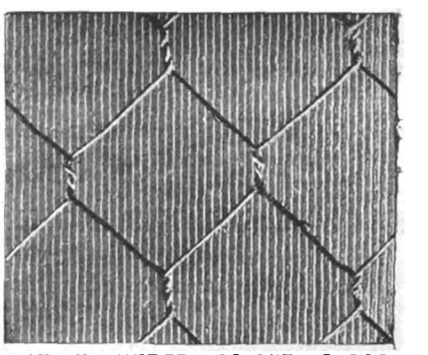
A. P. Laurie on a method of testing varnishes was read. The object of the method is to reduce to a definite standard the qualities of hardness and toughness. Professor Baily and Dr. Laurie have devised an apparatus which attains this object. The apparatus consists of a blunt steel point ground to a certain radius, upon which pressures can be put by means of a spiral spring. The varnish to be tested is painted on glass and allowed to dry. The steel point is drawn along the glass, and the pressure increased until it scratches the varnish. As the pressure is known, there is thus available a measure of the toughness and hardness. It is claimed that the apparatus, by providing a definite standard, will be of value to manufacturers.

The Employers' Parliamentary Council have issued from the House of Commons a paper setting forth observations on the Trades Disputes (Government) Bill and the Trades Unions and Trade Disputes (Private Members') Bill. They declare that the object of clause 1 of the Trades Unions and Trade Disputes Bill and clause 2 of the Government Bill is "to legalise intimidation." By other clauses it was asserted that labour unions would be enabled to inflict injury upon individuals with impunity, and to commit acts which are and would continue to be illegal and punishable when committed by any other class of the community. Clause 4 of the Government Bill would give great scope for fraudulent understandings between a trade union and its agents which, if carried out with sufficient secrecy, could never be established in legal proceedings. Moreover, it would inevitably give rise to a great amount of litigation for the purpose of determining what acts had been authorised or repudiated in any given case.

His Honour Judge Greenhow gave an interesting decision in the Wakefield County Court in a compensation case brought by a joiner against Messrs. E. Wood & Sons, Derby, contractors. The appellant whilst employed by the respondents to do the work in connection with a new goods warehouse for the Midland Railway, at Middlestown, fell from some scaffolding and received severe injuries. The point in dispute was as to whether the erection was a building 30 feet high within the meaning of the Act. The respondents contended that at the time of the accident the height from surface to ridge of the roof was only 27 feet, but for the applicant it was argued that the measurement should be taken from the bottom of the concrete foundation in which the supports were fixed, in which case the building was over 30 feet high. His Honour gave judgment for applicant. He said that the cases already decided were those of brick buildings. In this case he would rule that the bottom of the posts corresponded with the lowest brick in a brick building. Applicant would be paid compensation for twenty-seven weeks at half wage, 14*s.* 6*d.* per week, forthwith, and at 14*s.* 6*d.* per week until further notice.



The importance of municipal labour bureaux in Prussia, *i.e.* those which are either maintained and managed by, or receive a subvention from, the municipality is increasing. The number of vacant places registered there rose from 145,000 in 1897 to 457,400 in 1904, while the applicants numbered in the respective years 176,000 and 602,700, and the number of places filled through these bureaux increased from 104,300 to 322,800 respectively. Out of a total of 276 offices more than 200 had, however, a merely nominal existence, as for one reason or another their "results" are practically nil. The mixed system of administration, where masters and men participate in the management, is more successful than the purely "bureaucratic" system, which excludes the men from the management. Outside Prussia, more especially in South Germany, their importance is even greater; in Munich, for instance, the number of vacancies entered at the municipal bureau in 1904 was 64,100, the number of applicants 65,750, and 46,800 places were filled.

The *Iron and Coal Trades Review* has published "A Table of Constants for the Conversion of Canal Boat Gaugings to Standard Tons," which has been prepared by Mr. S. L. Thacker, of Walsall. Engineers, manufacturers, &c., will be able to easily ascertain the actual weight carried on canal boats, and thus keep a check. One of the disadvantages of canal traffic hitherto has been the irregular and unsystematic method of ascertaining the actual weights carried, the methods and gauges varying in different localities, and the actual weight being ultimately estimated by a species of guesswork more or less accurate, according to the experience of the boat-gauger.

ELECTRIC NOTES.

THE Erdington District Council have accepted the tender for the construction of Tramway No. 1 (from Salford Bridge to the Sutton boundary) submitted by Mr. George Law, of Kidderminster, at the price of 35,210*l.* It was also agreed to accept the tender of Mr. George Law, of Kidderminster, for the laying of the margins in the main Sutton Road with wood blocks from Salford Bridge to the Sutton boundary, at the sum of 16,927*l.*

MUNICIPAL ownership was partly approved by the voters of Chicago on April 3. The proposition to operate the street railways by city employés was voted down; there were 120,911 affirmative and 110,260 negative votes, but as a three-fifths vote was necessary to carry the proposition, it was lost. The vote to issue bonds to an amount not exceeding 75,000,000 dols. for the purchase and improvement of the street railway systems of the private companies was carried by about 3,800 votes.

THE Arbroath Town Council have agreed unanimously to give Mr. George Balfour, electrical engineer, London, their support in obtaining an electric light and power provisional order for Arbroath on the basis of an agreement to be entered into with him. Mr. Balfour is to erect the works on the shambles site previously proposed in the case of the Empire Electric Light Company, at a feu duty of 60*l.* per annum, Mr. Balfour undertaking that everything shall be completed within two years from the date of the order.

A PAPER on lifts and hoists, by Mr. H. C. Crews, was read recently before members of the Manchester section of the Institution of Electrical Engineers. It was remarked that fifteen years ago electric lifts were novelties that budding enthusiasts travelled miles to examine, but generally found "closed for alterations and repairs." Since then the lift had conquered, and at least five of the leading English lift firms were to-day turning out three-quarters of their machines electrically equipped. In Manchester and Salford the Corporation mains supplied current to over 200 highly economical electric hoists, apart from cranes, jibs, teagles, &c. In power supply the electrical engineers of the country had now, it was contended, opportunities in the ratio of 400 to 6 of competing successfully with hydraulic engineers for the most economical types of each equipment, for while there were only six public high-pressure hydraulic supplies in the country, there were 400 public electric supplies.

MUNICIPALITIES AND BUILDING LAND.

A BILL has been introduced by Mr. Munro Ferguson, supported by Mr. A. Williamson and Mr. Lamont—1. To enable municipal authorities and county councils in Scotland to acquire land compulsorily for public purposes at its market value.

2. To provide machinery by means of which effect may be given to the principle that the special increase in the value of land adjacent to populous places which is exclusively due to the growth and necessities of the population, as distinguished from the general rise in the value of land in the district, should be secured for the community which has created that special increase.

3. To provide means whereby land in the vicinity of populous places may be valued for rating purposes at its real value, as distinguished from what is actually received from it.

The first branch of the purpose of the Bill receives effect by an adaptation of the familiar machinery incorporated in the Lands Clauses Consolidation (Scotland) Act, 1845. The second is effected by providing powers to the local authority to have a valuation at the actual market value of any land which it is desirous, or conceives it may be desirous, of acquiring. This valuation is made at the expense of the authority desiring it, the costs of the landowner being provided for. And the authority is thus enabled at any period within twenty years from the date of such valuation, to acquire the land in question at the actual market price as between a willing seller and a willing buyer, minus so much as is attributable to the special unearned increment to the value of the land which has, since the date of the first valuation, been caused by the growth of the population. The control of this operation is vested in the Commission constituted by special provisions in the Bill, the function of which is to take care that the local authority does not abuse

CROSLAND HILL STONE, HUDDERSFIELD.

Best Crosland Hill Stone, suitable for all classes of good work, specified by most leading Architects for Church Work and Public Buildings.

Digitized by Google

its powers. The principle of this part of the Bill is to secure for the local authority in the future the growth of the value of land which is thus due to the population that it represents. The third part of the Bill in substance provides that building land is to be rated not merely on its actual annual yield, but, in the case of land kept unbuilt on with a view to the increase in its value, on an annual value equivalent to 4 per cent. on the actual capital value in the open market. The machinery of the Lands Clauses Consolidation (Scotland) Act, 1845, and of the existing Valuation Acts, has been adopted throughout the Bill.

THE "PRESTO" COMBINED LADDER AND TRAP-DOOR.

A DEMONSTRATION was given last week at St. Pancras of the capabilities of a combined extending ladder and balance trap-door, especially invented to meet the requirements of the London Building Acts Amendment Act 1905 (sect. 12). The ladder is made of stamped steel connected by levers to the trap-door in roof and balances same. When the ladder is out of use it folds up beneath the trap-door and requires a depth of only 15 inches, that is to say, the space between the trap-door to roof and that of ceiling level, leaving an entirely free floor space. On pulling a cord or chain the ladder and door is unlocked, the ladder opens out and extends to the floor, at the same time actuates and opens the trap-door in the roof, and throws up a hand-rail if required. On lifting or pushing the ladder up from the floor it folds up and at the same time withdraws the hand-rail, closes and securely locks the trap-door—all automatically, and is entirely out of sight when not in use. It may be added that the "Presto" ladder or trap-door cannot be opened or closed from the outside.

REVERSALS OF STRESS.

AT the ordinary meeting of the Institution of Civil Engineers on the 10th inst. a paper was read "On the Resistance of Iron and Steel to Reversals of Direct Stress" by Messrs. T. E. Stanton, D.Sc., and L. Bairstow, A.R.C.S. The following is an abstract of the paper :—

While recognising the valuable work which has been done by previous observers in the study of the fatigue of metals the authors call attention to the fact that further experimental work on the subject is much needed for the following reasons :—

1. Practically all the previous work, with the exception of Reynolds and Smith's experiments, has been done by subjecting the materials to transverse stresses, the intensity of which has, therefore, to be calculated by the ordinary theory of bending.

2. The resistance of the materials in common use by engineers at the present day when subject to reversals of stress is imperfectly known, and there exists considerable difference of opinion as to the materials best suited for stresses of this kind.

3. Although it appears from Reynolds and Smith's experiments that the resistance of iron and steel is seriously diminished when the alternations are very rapid (*i.e.* 1,500 to 2,000 per minute), it is not known if this reduction in resistance is considerable at those speeds which are common in high-speed reciprocating motors (*i.e.* in the neighbourhood of 800 reversals per minute), since the majority of experiments have been made at approximately 60 reversals per minute.

4. Although it is generally recognised that the effect of moderately rapid or sudden changes in section of materials subject to reversals of stress is to diminish their resistance, the amount of this reduction in strength for the various materials commonly used is not known.

5. The common assumption that, in cases in which the stress varies from tension to compression, but between unequal limits, the resistance depends solely on the range of stress and not on the actual values of these limits, has not been experimentally verified.

From these considerations it was decided to undertake a research, the object of which should be the experimental determination of the resistance of certain kinds of iron and steel, under the special conditions mentioned in the above paragraphs, when subject to reversals of direct stress. The experiments were made on the alternating stress testing machine which has been designed and constructed at the

National Physical Laboratory, and which has been fully described in *Engineering* (February 17, 1905). Jointly with this work a microscopical investigation has been made of the changes which take place in the crystalline structure of materials under reversals of stress as the test proceeds, to determine if possible the manner in which ultimate failure occurs.

The materials upon which the tests have been made may be conveniently divided into three groups :—

1. Three samples of Swedish Bessemer steel and one sample of Swedish charcoal iron presented by Mr. R. A. Hadfield for the purpose. The carbon content of the steels was approximately 0.17, 0.44 and 0.64 per cent.

2. Four samples of steel presented by Messrs. Belliss & Morcom for the purpose. Of these, two were mild-steel bars, one was a bar of harder steel used for piston-rods, and the fourth consisted of specimens which had been cut from a large steel forging.

3. Two samples of wrought-iron of British manufacture, bought for the purpose of the tests.

Although more uniformity in the results of the tests would no doubt have been obtained by subjecting all the specimens cut from any given material to an annealing process, it was felt that this would detract from the value of the tests owing to the well-known effect of heat treatment on the resistance of steel. For this reason the tests were made on the bars as received, and in cases in which there were several bars of the same material the specimens in any group of tests were not always cut from the same bar. This does not apply to the case of the specimens whose structure was examined microscopically, in which the actual resistance was of secondary importance.

The results of the experiments may be stated briefly as follows :—

1. The superiority, in resistance to reversals of stress, of moderately high-carbon steels over low-carbon steels and wrought-irons, which was discovered by Wöhler to exist when the rate of reversals was 60 per minute, still holds when this rate is increased to 800 per minute, although according to Reynolds and Smith's experiments this superiority no longer exists when the rate of reversals is in the neighbourhood of 2,000 per minute.

2. As far as comparisons can be made between the results of the present experiments and those of Wöhler and Sir Benjamin Baker, there is no marked reduction in resistance due to raising the rate of reversals to 800 per minute.

3. Experiments in which the ratio of tension to compression varied from 1.4 to 0.72 indicated that between these limits the value of the maximum range of stress was practically independent of the actual values of the limiting stresses in tension and compression.

4. The resistance of the materials in three typical cases of rapid reduction of area of the specimens has been determined.

5. The failure of iron specimens due to the development of the slip-lines of Ewing and Rosenhain into cracks has been determined for the case of direct stress, and the failure of moderately high-carbon steel, due to the development of cracks in the ferritic areas of the structure, has also been established.

WORKMEN'S COMPENSATION.

AN important article by Judge Parry on the Bill before Parliament has appeared in the *Manchester Guardian*. His Honour says :—The text of the Bill to consolidate and amend the Workmen's Compensation Acts is now in our hands, and it is universally admitted that even if the Bill were pushed through Parliament as it stands we should have to credit Mr. Secretary Gladstone with a brave step in advance in this important social reform. But the days of heaven-sent legislation are over, and as criticism in legislative matters seems once again not unwelcome, perhaps the views of a county court judge on the merits of the Bill are not wholly impertinent.

In reading the debates on the measure I am struck with the knowledge and experience of the existing law shown by the Labour members. The noble army of lawyers in the House seem very silent as to its provisions. It may be that they expect their turn to come by-and-by in another place, but I cannot help thinking the real truth is that there are not many lawyers who know much about the subject. The only people I have ever come across who had any real practical knowledge of the subject were either county

court officials, medical referees, trade union secretaries, or insurance men. They are face to face in their daily life with the practical working of the Acts, and the trade-union members in the House seem to be the only critics of the Bill with any real grip of the subject. Naturally, they are for a very wide extension of the old Acts, but if some of the other classes I named were represented in the House a strong case could be made out for spending more time over perfecting the machinery of the Bill and leaving the addition of new classes of workers to a later date. For, whatever departmental officials may say to the contrary, the litigation caused by the present Acts is a scandal. It has wasted the moneys of employers and workmen, it has wasted the time of our great Appeal Courts in futile discussions, and it has exhibited among judges a curious inability to agree when the matter in dispute is rather a question of social policy than the construction of legal phraseology. The departmental answer that the cases litigated are only a small percentage of the cases settled is in no way comforting to those who know the facts, nor is it anything but a misleading answer. Let the litigation under the Compensation Act of 1897 be compared with the litigation under any other similar statute, and it will be apparent that the amount of litigation and appeal in Compensation Act cases is excessive. Personally I know of no one subject that takes up so much of my time in the county court, and I have no doubt that this is the experience of judges in all the urban centres.

It is therefore with great pleasure that at the very outset one finds a determined effort to put the inclusion of workmen in the Bill on a sound business principle. In future a workman is to be within the Bill unless excluded in clear terms. That will at once sweep away the absurd speculation as to when a building is 30 feet high—whether Edinburgh Castle, for instance, was to be measured from Princes Street or the Castle Rock; no longer shall we hear counsel propounding the theory that a ship is a dock or a factory, or witness a puzzled Court of Appeal groping for light as to the true inwardness of a warehouse. Never were there such a succession of absurdities argued in courts of law, and it still remains the boast of the Court of Appeal that, beset and beseeched by many litigants and admonished by the House of Lords, it never did decide what a scaffold was. Let us be thankful to Mr. Secretary Gladstone that all that class of litigation is ended.

But another clause which has given rise to a large amount of litigation still, I regret to see, remains. A workman under the new Bill can still only recover if the accident arises "out of and in the course of his employment." These words always come to my mind in conjunction with the words of the Psalmist, who sings of someone who "frameth mischief by a law." For what more mischievous words could have been introduced into a statute? They have been construed to mean everything they were not intended to mean, and not to mean everything they were intended to mean, and they are utterly without health. In the same way as the authors of the Bill have said all workmen should be included who are not excluded, so should they say all accidents are to be included unless caused by serious and wilful misconduct. But at present the onus is upon the workman of proving that each particular accident "arose out of and in the course of" the employment. Mr. Chamberlain, I feel sure, never intended that his scheme should be injured by such words, and I have no doubt Parliament supposed they meant the same as "during employment" or "whilst employed." But they do not, and in the face of the litigation they have caused, and have continued to cause, it is regrettable indeed to find them in the text of the new Bill.

Let me give a few instances of how they have been employed to deprive workmen of compensation. In a case in Manchester a fireman in the employ of a railway company was travelling in a train. Two fellow-workmen were with him. They were talking together, and they last noticed him putting his basket on the rack. They heard a noise, turned round and saw an open door. The man had fallen out and was killed. The case was really one of "unexplained accident." There was no suggestion made of insobriety or suicide. The accident was the only evidence. I considered that on proof of an accident of this kind the onus should be on the company of proving affirmatively that the accident did not arise "out of" the employment, but I was wrong. The Court of Appeal said that "the burden—and the whole burden—of proving the conditions essential to relief rests upon the plaintiff (*sic*—they meant applicant) and upon nobody else, and if he leaves the case

in doubt as to whether those conditions are fulfilled or not where it is equally consistent with their being fulfilled or not fulfilled, he has not discharged the onus." The practical meaning of this is that the widows and fatherless have to prove by evidence how their breadwinner died before they come within the Act; and I suggest that this is not what Parliament intends or desires. As a matter of fact, after two hearings and two appeals, the widow in the above case got compensation—why, I never well understood. Another case was that of a ticket collector who jumped on the footboard to speak to a passenger. What he spoke about was not an affair of the company's, and his representatives got nothing. On the other hand, an engine-driver crossed some rails to speak to another engine-driver upon a matter having nothing to do with his business and was killed whilst walking back to his engine. His representatives recovered. A judge has held that an accident happening to a painter while going to relieve nature during the breakfast-time did not arise out of his employment, and the Court of Appeal have since held that a workman injured during his dinner-hour —although paid by time—is entitled to compensation. A large class of cases turn on what is called the "sphere of employment." If a man is employed to do *x* and he does *y* he does it at his own risk, and if injured may or may not be compensated, but if he does get compensation it is not likely he will get it without litigation. Now this is bad business for workmen, and I have no doubt that the words are of no value to the employer. An occasional widow and a few orphans may be deprived of compensation, but the words do not lower the insurance rates. They are worth nothing to anyone, unless it be to lawyers; and one hopes that before the new Bill becomes an Act of Parliament it will enact that for every accident a workman is entitled to compensation unless his employer can prove him guilty of serious and wilful misconduct.

The new regulations as to the use of the medical referee are excellent as far as they go, but where a case in dispute is in the first instance a medical dispute there ought to be a summary method of getting to the medical referee without delay. I should like also to see a clause enabling a judge to fix a sum for redemption in cases of neurasthenia where the doctor advises that the continuance of weekly payments is in itself retarding the patient's recovery. There are, I am sure, a growing number of cases in which the applicant is not a malingerer, but is what the doctors call neurasthenic, and if he knew that he had so much in hand and that the litigation was over there is every reason to believe he could get to work. These cases are very difficult to deal with and are on the increase, and I recognise that it would be difficult to draft a satisfactory clause; but the fact that there are so many of these cases emphasises the necessity of larger judicial power being given to the medical referee, who alone possesses the knowledge to give a right judgment in such matters.

One more matter—a pet scheme of my own—and I have done. I earnestly hope that some money will be allowed—preferably out of public funds, but if this is impossible a small percentage out of the compensation money paid into court—to be spent on inquiries and skilled advice for the benefit of widows and children whose funds are in court. In my court I have to administer the affairs of 325 widows and children and a fund of some 9,000*l.* which it is my duty to see is applied for their benefit. I have no doubt that the money could be better expended than it is if one had some means of inquiry into the statements made by these poor beneficiaries, to whom the fund in hand appears inexhaustible and from whom one cannot expect businesslike views and sound economy. Many a time I have felt that if I had a properly accredited agent to purchase a business for a widow I should be able to obtain it for her on better terms, and that the friends or relations who were acting for her were not the best equipped people for doing business in a city where "wickedness is in the midst thereof and deceit and guile depart not from her streets." This is, however, a matter which I know will receive the most sympathetic attention at the hands of the author of the Bill. No one supposes that it will be enacted in exactly the form of its first imprint, but I for one hope that in endeavouring to enlarge its sphere it may not become necessary to withdraw it for the purpose of working out some larger and more scientific scheme. The Bill as it stands is so excellent a reform for the working class that anyone who takes an interest in their welfare must honestly wish it God-speed. A bird in the hand of a Gladstone is worth many coveys in the Chamberlain bush.

HALL'S SANITARY WASHABLE DISTEMPER

The Refinement of Good Taste in Wall Decoration

is shewn in the choice of Hall's Sanitary Washable Distemper. This is a wall covering that is at once artistic, practical, and economical.

Its practical advantages are simplicity, durability, and cheapness. Only water is required to be added to make Hall's Distemper ready for use. It is unaffected by light, heat, or damp, does not crack or peel off, and is washable.

It is made in 73 colours, including rich dark as well as light shades; in actual cost it is cheaper than wall paper or flatted paint, and being applied with a whitewash brush represents a further great saving in labour.

"Sisco" White Japan is the correct material for painting Doors, Picture Rails, and all woodwork of rooms decorated with Hall's Distemper. "Sisco" Japan is a pure white decorator's enamel, which dries with a hard, smooth, lustrous surface. It lasts for many years with beauty unimpaired.

"Modern Development in House Decoration," a beautiful booklet with coloured views of Drawing, Dining, Bedroom, and Library, sent post free on application (with samples and shade-card of Hall's Distemper if specially requested), from the sole manufacturers,

THE MOMENTUM ENGINE (Patented). The Discovery of Mechanically-made Power.

NOW IN OPERATION AT THE ALEXANDRA PALACE, LONDON, N.

The discovery; that, a free racing Flywheel possesses two natures, under one—it will receive rotary motion for the application of twenty pounds—notwithstanding it weighs a ton, and the second nature of the Flywheel is, that when it is connected to a working load it will throw out the rotary value of the centres of the weights in motion, by the square of the velocity, the centre of Gyration.

This discovery means several great Flywheels, each separately driven by any motive power, each Flywheel taking its regular turn to revolve a working shaft, to which it is connected, and from which it is disconnected for a greater length of time. Radium, and also these Engines, prove that the Theory of Energy is false. This Engine can be seen running the electric light at the Alexandra Palace. It is explained free.

The Engine has taken a first-class Diploma of Merit at the Alexandra Palace for Electric Lighting.

HALL'S Sanitary Washable DISTEMPER

The Real Sanitary Water Paint.

Hall's Distemper is the real Washable Distemper. It was one of the first invented, and is to-day better than ever, because the Manufacturers have, by reason of many years of scientific and practical tests, continually improved its manufacture until perfection has been attained.

Hall's Distemper is made in two qualities—the inside quality is specially for interior wall decoration, the outside quality being most suitable for all other purposes, both inside and out, whether on wood, stone, brickwork, or any kind of building material.

Its utility for Farm and Estate Buildings, such as dairy and tool-sheds, kennels, barns, shooting boxes, and temporary buildings of all sorts, is remarkable.

Full particulars of Hall's Distemper, in the form of a beautiful booklet, entitled "Modern Development in House Decoration," will be sent post free on application to the Sole Proprietors and Manufacturers,

SISSONS BROTHERS & CO., Ltd., HULL.

London Office: 199b Borough High Street, S.E.

A LIST of ART PLATES published in "THE ARCHITECT" will be forwarded on application to GILBERT WOOD & CO. Ltd., Publishers, Imperial Buildings, Ludgate Circus, E.C.

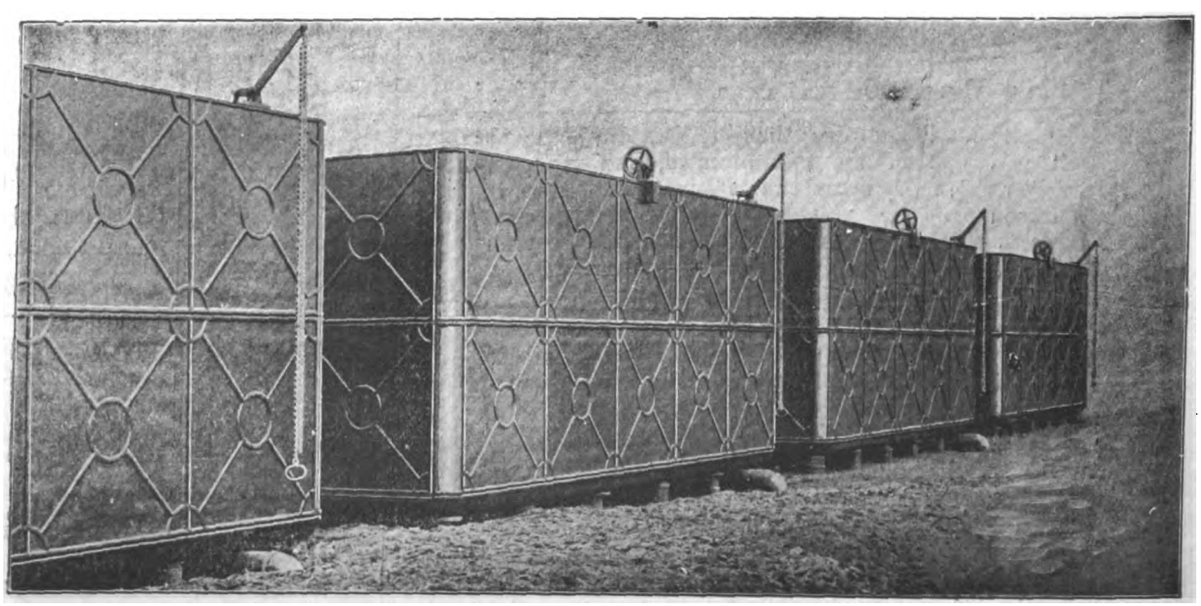
Made solely by W. NEWMAN & SONS,
DOOR SPRING MAKERS AND BRASSFOUNDERS, **HOSPITAL ST., BIRMINGHAM.**
ESTABLISHED OVER 100 YEARS.

AWARDED SILVER MEDAL, SANITARY INSTITUTE, 1902.

THE BRITISH SANITARY CO.'S NEW AND IMPROVED SELF-ACTING EARTH CLOSET.



HIGHEST AWARDS:
Birkenhead, 1881; Newcastle-on-Tyne, 1882; Glasgow, 1883; Dublin, 1884; Plymouth, 1885; Edinburgh, 1886; Glasgow, 1887; Haddington, 1892; Liverpool, 1894; Newcastle-on-Tyne, 1896.

For Simplicity and Efficiency their Closet stands alone.
Medal from the Society of Architects, London, for superiority of workmanship and materials used in manufacture of Closets.

ITS ADVANTAGES ARE:—
1ST. The simplicity, strength of the mechanism, and non-liability to get out of order. 2ND. It is self-acting. 3RD. The effective distribution of the deodorising material thoroughly covers and absorbs all offensive matter and smells. 4TH. The large capacity of the containing magazine holding the earth or other deodorising material. 5TH. The very moderate price it can be sold at as compared with other closets not even possessing the above advantages.

PRICE LIST AND FULL PARTICULARS SENT ON APPLICATION TO
THE BRITISH SANITARY COMPANY, 341 BATH LANE (at Charing Cross Station), NORTH STREET, GLASGOW.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

"Standard" Ware is sanitary because its snowy surface is non-porous, without crack or crevice for dirt to lodge. The complete equipment can be bought and installed at very moderate cost. A bath-room equipped with **"Standard"** Ware adds a cash value to property far in excess of cost of installation, and brings more comfort and satisfaction than any room in the house.

Write for our elaborate catalogue, **"MODERN BATHROOMS,"** also for our special lavatory booklet, showing many new Patterns. Address Department F.

TRADE NOTES.

The Congregational church, Grimsby, is being ventilated by means of Shorland's patent roof ventilators and special inlet ventilating panels.

Messrs. Oetzmann & Co. have brought out a new edition of their catalogue of house furniture with about 2,000 illustrations. Having sixty years' experience they know the requirements of the public, and have arranged to meet them economically. A copy of this catalogue, which is a complete guide to house furnishing, is sent free to every applicant.

English pencil makers will have to bestir themselves, for there is a new competitor in the American Lead Pencil Company. There are no less than seventeen grades, ranging from "softest and blackest" to "hardest and firmest." The pencils are most easy in working, whether for writing, line drawing or freehand drawing, and a case of them is an equipment which architects, engineers and draughtsmen will find to be available for all classes of work.

The Horsfall Destructor Company, Ltd., of Leeds, who are finding their foreign trade increasing, are about to change their London address from 19 Old Queen Street, Westminster, S.W., to 110 Cannon Street, E.C. The head office will remain, as heretofore, at Leeds. The Westminster office has hitherto been conducted as a branch office with a small staff. The new City office will be under the supervision of the well-known firm, Messrs. Findlay, Durham & Brodie, who keep a large technical and commercial staff. After May 1 all postal communications should be addressed to "The Horsfall Destructor Company, Ltd., 110 Cannon Street, London, E.C.," and cables and telegrams, as heretofore, to "Destructor, London" (all the usual codes being available). Telephone No. "8517 Bank."

"A History of Architecture on the Comparative Method," by Professor Banister Fletcher and Banister F. Fletcher, is to be translated into Russian by M. Robert Böker, of St. Petersburg, to whom the Russian rights of translation have been sold. This is a somewhat unique event to happen to an English text-book, and shows the extreme popularity of the comparative methods adopted by the authors.

MR. HARRY BLACKADDER, burgh surveyor, North Berwick, has been appointed to the surveyorship of Bridge of Allan.

THE South Wales Federation of Employers have joined the National Building Trades Conciliation Board.

THE Government of New South Wales are about to provide a school of engineering to the Sydney University at a cost of 20,000*l.* for buildings and 5,000*l.* for machinery.

THE Port and Haven Commissioners of Yarmouth have decided to employ Jarrah wood instead of Memel timber for the piling at the North Pier works. It was stated that Jarrah, after from thirty to fifty years in harbours, remained in sound condition.

Two large blocks of buildings in the Temple in Essex Court and Plowden Buildings have had to be shored up, owing to an apparent sinking of the foundations. The buildings were erected in 1667. The outer walls will have to be reconstructed.

THE new wing added to the Glasgow Stock Exchange has been opened. The first or principal floor comprises the new mining market, telephone corridor and smoking-room. The new mining market is a room about 50 feet by 42 feet and 22 feet in height. An Otis elevator connects all the floors. The architect is Mr. John James Burnet, Glasgow.

THE West Riding education committee have decided that an elementary school for 300 children is to be erected at Normanton Common at a cost of 3,600*l.*; additional accommodation at the Goldthorpe provided school for 180 scholars, at a cost of 1,800*l.*; and at Lound new school, Ecclesfield, for 420 children, at a cost of 6,200*l.*

PART of the nave of Thorney Abbey, probably the oldest parish church in Cambridgeshire, fell in on Monday. Workmen had been releading it, and had noticed its timeworn condition, but there was no warning of the disaster Fortunately there was no personal injury suffered. The abbey was formerly a cell of Peterborough monastery, and is equidistant between that city and Crowland.

A PROPOSAL has been made by the builders of Stirling that masons' wages should be reduced. The present rate is 9*d.* per hour. A conference between masters and representatives of the men has been held, and it was agreed to refer the question at issue to arbitration, the arbitrators being Provost Thomson, Bailie Steel and Mr. J. D. M'Jannet, Woodlands.

THE traffic committee of Berlin municipality have decided to visit London and Paris for the purpose of studying the measures taken for dealing with traffic. Particular attention will be paid to underground railways. The committee's visit to London will coincide with that of the burgomasters and councillors of various German cities, which has been arranged for next month.

THE York Chamber of Commerce have unanimously passed the following resolution:—"That with a view of carrying out much-needed improvements on the river Ouse, it is desirable that a resident river engineer be appointed, who shall also discharge the duties of secretary and manager to the Navigation, and that the City Council be urged to take this matter into their immediate consideration."

THE Dundee water committee recommend a scheme to maintain the permanence of the supply from the Loch of Lintrathen. The first pipe laid from that source for many years has been a source of trouble, and along its line bursts have from time to time occurred. The engineer has been instructed to prepare plans for relaying the old main (a 27-inch pipe) over a distance of four miles, at an estimated cost of 17,000*l.*

THE Middlesbrough Town Council have directed a subcommittee to seek an interview with the promoters of the

Middlesbrough and West Hartlepool Light Railway, who propose to construct a transporter bridge across the Tees at Middlesbrough, with the object of obtaining better terms for the Middlesbrough Corporation than have yet been offered. If sufficiently good terms can be obtained the opposition to the scheme will be withdrawn.

THE Sunderland Town Council recently dismissed a proposal to establish manual instruction centres owing to opposition by the joiners, who contended that the system tends to undue competition in the joiners' trade. The education committee on Tuesday again considered the proposal, and it was agreed to defer the matter for a month to enable certain misunderstandings as to their intentions to be corrected.

THE Malpas Rural Council have received a letter from the Liverpool City Council granting a loan of 2,500*l.* for the purpose of erecting twelve cottages under the provisions of the Working Classes Dwellings Act. The plans have been prepared and a tender has been accepted for the erection of the cottages. The scheme is believed to be the first one attempted by a rural authority in Cheshire. The rent of houses free of rates is estimated to reach 3*s.* 9*d.* a week and tenants are already waiting to occupy them.

THE medical officer to the Charlton Kings' District Council in his annual report remarks that the infectious character of phthisis is largely due to the presence of dust acting as a medium. The report continues:—"Disagreeable though the motor-car is to all but its occupants, I have long since realised that it has perhaps one virtue—its smell. This is not saying much for it, I know, but it may in part counteract some of the dangers of the dust it scatters to the annoyance as well as to the detriment of the general public."

THE first meeting of the local Conciliation Board in connection with the building trade was held at the Builders' Exchange, Sheffield, on Monday. Mr. A. J. Forsdike was appointed chairman of the newly constituted body; Mr. T. Driver, vice-chairman; Mr. J. L. Taffe, secretary for the masters; and Mr. H. H. Diver, secretary for the operatives. It was resolved that voting should be by ballot, and that the expenses of the Board, except those of the secretary and representatives, should be borne in equal shares by both parties.

THE public elementary schools which Mr. and Mrs. George Cadbury have built at Bournville were opened for the reception of scholars on Monday. The schools are designed to accommodate 540 scholars—270 boys and an equal number of girls—and have cost upwards of 30,000*l.* to build, furnish and equip. They stand in the centre of the village. The buildings have been designed by Mr. Alexander W. Harvey, consulting architect to the Bournville Village Trust, and their construction has been carried out by Messrs. J. Bowen & Sons, of Birmingham.

MESSRS. TOPHAM, JONES & RAILTON are progressing rapidly with the construction of the new King's Dock at Swansea. The sea has now been shut out. The stone embankment contains about three-quarters of a million tons of stone, nearly the whole of this enormous quantity having been deposited since January last year. It is believed the contractors will be able to complete the work quite a year before the time stipulated in the contract. The Swansea Harbour Trust have arranged with the contractors that if they complete the works before June 9, 1910, or such further time as might be allowed by the engineers under the contract, they shall be paid by the Trust a bonus at the rate of 400*l.* per week up to 20,000*l.*

THE half-yearly meeting of the executive of the Scottish Building Trades' Federation was held in the Building Trades' Exchange, 26 George Street, Edinburgh, on the 20th inst. Mr. James Leslie, of the Aberdeen Association, was appointed vice-president of the Federation. A voluminous correspondence was read by the secretary which showed that he had been in touch with every town of note in Scotland with a view to extending the Federation, and as a consequence of this it was reported that several associations in the West and North had indicated their desire to become federated with the Scottish Federation. Arrangements were made for visiting these towns. The annual meeting of the Federation was fixed to be held at Edinburgh in September.

THE British Garden Cities, Ltd., have acquired a site extending over 365 acres about three miles from Chatham on which they will commence operations. The company will at first restrict themselves to parcelling out the estate, selling freehold plots for buildings and providing sewers and roads. Purchasers of plots will be free to build houses or

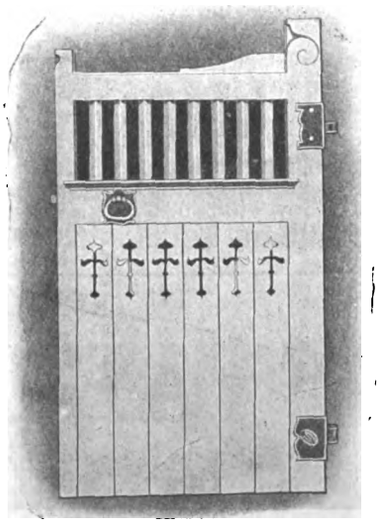
cottages as they wish, subject to certain specifications and designs of the company. The company will later be prepared to financially assist plot-buyers to build, and to undertake the supply of gas, water and electric light. The plots will have a frontage of 25 feet and a depth of 200 feet each, and it is proposed to sell them on the easy purchase principle in lots of not less than two. No cottage will be allowed to be erected at a less cost than 250*l.*

AT the Southwark County Court on Monday a claim was brought under the Workmen's Compensation Act by Annie Jones against the South-Eastern and Chatham Railway Company. Mrs. Jones is the widow of a painter who was killed at Charing Cross station by the fall of the roof on December 5 while at work for the railway company. Jones left four children who were dependent upon him. The respondents admitted their liability, and had paid into Court 231*l.* and the costs. It was desired that his Honour would make an order for the distribution of the sum. There were two boys, aged thirteen and eleven, and two girls, aged eight and three. An order was made granting the widow 20*l.* down, each of the two girls 20*l.*, to be invested for their benefit, and the remainder to be invested and paid out to the widow at the rate of 10*s.* per week.



THE Roads Improvement Association, in their annual report, state that the Association has taken the lead in the endeavours to induce local authorities to meet the convenience of the public by constructing their roads of dustless materials. Jointly with the Automobile Mutual Protection Association, they are organising experiments with several different kinds of dustless road material in order to test the comparative effectiveness, durability and cost, and it is prepared to contribute 1,000*l.* towards the cost of these experiments. In the opinion of the Association experiments of this kind should be conducted by the State, which should advise the local authorities from time to time as to the best means of making and repairing their roads. Until the State, however, undertakes this work, the Association, to the best of its ability and the extent of its resources, is acting as the intelligence department in all matters connected with highway administration in this country.

IN his annual report Dr. A. Wynter Blyth, medical officer of health for Marylebone, deals with the question of overcrowding and occupation of kitchens. The whole of the legislation with regard to underground rooms requires, in his opinion, much revision. "There are thousands who work in rooms and places lit by artificial light much below the level of the street without apparent injury, and because a place or room is below the level of the pavement it does not necessarily follow that it is not a proper place to live in. With regard to ordinary kitchens, all analyses of the air show that as a rule the air is purer than in the rest of the house. It is by the kitchen and basement that most of the air enters. I have, indeed, found in tenement houses the air of the upper storeys by far the worst air. On the other hand, not a few of the underground rooms are dark and many of them damp. Darkness and dampness are in themselves sanitary defects of a serious character, rendering any room unfit for separate habitation, and does not touch the absurdity of drawing out a schedule of structural conditions any one of which, however trivial, renders the room legally uninhabitable."

THE Local Government Board have given an important decision with respect to the upkeep of main roads and the carrying out of widening of roads when such work has been undertaken by the urban district councils without the direction and sanction of the County Council. For several years the Abergele Council have had a dispute with the Denbighshire County Council as to the cost of the upkeep of main roads, and the latter authority disputed their liability to pay the cost of widening Dundonald Avenue. The matter was referred to the Local Government Board for arbitration, and an inspector sat for three days last December to hear evidence. The award has been received. In it the Abergele Council have maintained their case. They are awarded 455*l.* 11*s.* 4*d.*, to be paid at once, as against 320*l.* originally offered by the County Council, and 1,235*l.*, as against 1,000*l.* offered. This sum is to be repaid by annual instalments, viz. 40*l.* 0*s.* 7*d.* for twenty years and 54*l.* 6*s.* 2*d.* for eight years, as against thirty annual repayments, if liable for anything, asked for by the County Council. The cost of the inquiry, 30*l.* 8*s.* 3*d.*, is to be equally borne by the two councils, and whereas the County Council asked for their costs, the Local Government Board directs both sides to pay their own expenses.

ELECTRIC NOTES.

The electricity committee of Dundee Town Council have received a letter from Mr. H. Richardson, the engineer, in which he stated that it was now too late to install at the electric station extra plant of any kind to be of any use to meet next winter's load. He pointed out that there was an insufficient stand-by, and that the plant and cables were fully loaded up. In connection with the proposed new electricity station, Mr. Richardson was authorised to visit certain manufacturers' works dealing with the supply of power on a large scale.

The London Electric Supply Corporation announce that one of the most important electrical power supply contracts yet made in London has been entered into by the Corporation, for the supply of power to the London, Brighton and South Coast Railway for working the trains on their South London line between London Bridge and Victoria. The contract is for a period of seven years. This is the large contract which was referred to in the report of the proceedings at the annual meeting, as well as the new contract entered into with the London County Council for a period of three years for the supply of power to the Council's tramways, to commence at the expiration of the existing agreement.

The Worcester City Council on Tuesday adopted a recommendation to concentrate the whole of the steam-generating plant now divided between the Powick and city stations at the latter, using the former only for the generation of electricity by water-power. The engineer reported that the whole of the steam-producing plant at the Powick station was obsolete, though it had been in use only twelve years, and recommended the substitution of new plant to be placed in the city works. Plant which originally cost 9,000*l.* he recommended should be "scrapped," and at a cost of 5,000*l.* he so proposed to extend the equipment of the city station as to effect a saving in production of 700*l.* per annum.

The Johannesburg correspondent of the *Financial Times* states that Messrs. Armstrong & Jones have been two months there investigating the local features of the scheme for the supply to the Rand of electric power generated by the famous Victoria Falls on the Zambesi. They have just completed satisfactory contracts, and are returning to London with a view to the flotation of the scheme, probably in June. The generating and transmitting plant, it is hoped, will be completed in about two years, and of the 30,000 horse-power intended to be produced at the Victoria Falls it is estimated that the company should be able to deliver 20,000 horse-power on the Rand. There will be a reserve steam generating plant in the vicinity of Johannesburg, with a capacity of 20,000 horse-power. The provision of cheap electric power would prove an immense factor in the development of new industries at present impossible owing to the absence of facilities.

A memorandum received at H.M. Embassy at Washington from the United States Department of State, on the subject of the advertisements of the Isthmian Canal Commission for miscellaneous supplies, points out that the urgent need of materials on the Isthmus will not permit the Canal Commission at present to advertise for a longer period than has hitherto been the practice, but that as soon as the conditions on the Isthmus with regard to supply of materials needed will warrant it additional time for putting in bids will be allowed, as it is the desire of the Commission to secure as many bids as possible on all materials required.

The Navigation Road Council schools, Altrincham, Cheshire, were opened by his Honour Judge J. K. Bradbury, on Tuesday, the 24th inst. The schools are arranged in three separate departments, and contain accommodation as follows:—Infants' department, 190; junior mixed department, 300; senior mixed department, 300. Special provision is also made for instruction in science and art, cookery and manual instruction, separate accommodation being provided for these purposes. The total cost of the school is approximately 13,214*l.*, and the whole of the work has been carried out from the designs and under the superintendence of Mr. W. Owen, A.R.I.B.A., Duchy Chambers, Clarence Street, Manchester, Mr. Thomas Clayton having acted as clerk of the works. The contractor for the general work is Mr. W. Thorpe, Chester Road, Old Trafford, Manchester, who has executed the work in a very efficient manner.

NEW CATALOGUE.

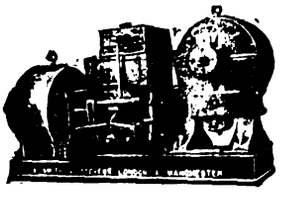
The latest retail pattern-book price list of the Anaglypta and Salamander decorations show several photographic illustrations of designs introduced for the business of 1906. Among the artists thus represented we note Messrs. G. R. Kennerley, G. C. Haite, J. Lamb, J. Baird, A. Jonquet, Owen W. Davis, T. Sheffield, O. P. Moller and R. Rainger. The styles introduced by them are most varied, including Italian, Louis XV., Elizabethan, Georgian, French, Adams, Renaissance, &c. By way of preface to the volume, some few pages are devoted to general remarks and instructions which will be found invaluable by all about to set up these forms of decorations. It is believed that the sketch plans given will be of service to architects and decorators when preparing plans showing the application of a pattern to a given ceiling, as the plans can be traced from the sketches and adjusted to the ceiling plan; the scale adopted is ¾ inch to a foot, or 1 in 16. The photographic reproductions of the patterns are of an extraordinary clearness, and in some cases are of actual size. The patterns are those used for ceilings, dadoes, borders, filling, friezes, patera, diapers, panelling, bosses and pilasters. The company claim that the high-relief goods will be found by no means a costly decoration or troublesome to use. "When fixed and finished with paint, and flatted in a vellum or plaster colour, they are highly decorative by reason of the form and projection of the pattern, and the consequent light and shade. The effect will be found as good as wood or plaster, and of far less cost in money and in time required for the work, because elaborate colour schemes are not a necessity." The catalogue, apart from its special use, can be taken as an exemplification of the latest modes of surface ornamentation.

THE PICCADILLY HOTEL.

Passengers along Regent Street and Piccadilly during the last few weeks, says the *Observer*, have been much interested in the immense cavity which occupies the place of the demolished St. James's Hall. About half a million tons of earth have been carted away, and now an army of workmen are busy, 38 feet below the street level, laying down the great blocks of concrete which are to form the foundations of the new building, the Piccadilly Hotel.

What the new hotel is to be like, and what the future of the quadrant is to be, have been subjects of much curiosity. Some details can now be given. The Treasury, on the lease of the St. James's Hall and the adjoining buildings being surrendered into their hands, decided that they would retain the present idea of the uniform quadrant. The leases of the surrounding property also fall to the Crown in the course of fourteen years, so that it was possible to decide upon a plan of rebuilding at once. As the question touches one of the beauties of London an advisory committee was appointed by the Treasury, and it nominated Mr. Norman Shaw, R.A., as the designer of the new quadrant.

His design will be seen at the Royal Academy Exhibition next month, and it may be said that it is an exceedingly beautiful one. The general style of the architecture forming the quadrant will be Classic, and Portland stone, which is the only stone capable of withstanding the London atmosphere, will replace the present stucco. Along the whole length of the quadrant will run a series of semi-circular arches, taking in the shops. Above the arches the buildings will be very attractive. The upper floors will be recessed with coupled columns, forming a long and beautiful colonnade.



The whole scheme will probably be completed in about twenty years, and will equal anything in street architecture to be seen in Europe. The first portion to be finished will be, of course, the Piccadilly Hotel, which, it is expected, will be open in about eighteen months, and will cost about 300,000*l.*, apart from furnishing and decorations. Other leaseholders may decide to rebuild before their leases expire, in which case a considerable portion of the new quadrant would be rebuilt before the lapse of fourteen years.

On the Piccadilly side the new hotel will have a different character of design to that on Regent Street. The system of arches for shops will, however, be the same. On the second floor level a novel feature in London hotel architecture will be seen—a large terrace where guests may exercise or dine. The terrace will be 120 feet in length and 50 feet in depth, and will be quite open to the sky, fine

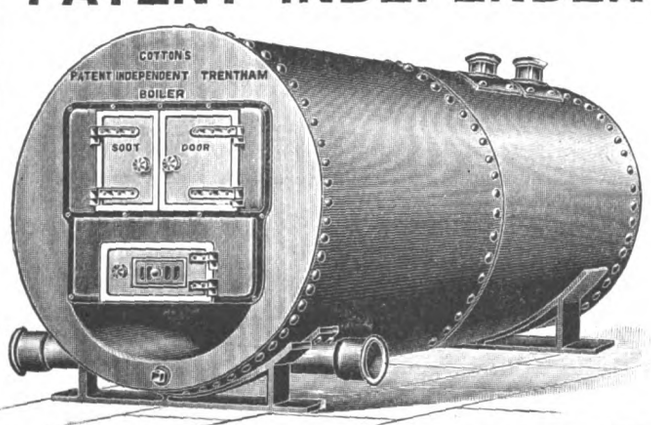
detached columns fronting it. The interior of the hotel will be in keeping with the classic beauty of the exterior, there being an absence of the over-elaborate decoration which is now so common in restaurants and hotels. The planning of the interior, as may be well understood, will leave nothing undone in the way of the most up-to-date service and accommodation, including Turkish and other baths in the basement, and spacious lounges, apartments *en suite*, and all the details which provide for the comfort of the visitors and residents. Mr. Norman Shaw is responsible for the Piccadilly as well as the Regent Street elevation of the hotel. The joint architects are Mr. William Woodward, of 13 Southampton Street, Strand, and Mr. Walter Emden, of 2 Lancaster Place, who have worked throughout in conjunction and harmony with Mr. Shaw.



The completion of the hotel will mark an important stage in the improvement of Piccadilly. The new building is to be set back about 28 feet, as compared with the former shops, making Piccadilly 80 feet clear in width at that point. When the Piccadilly Circus corner—Messrs. Swan & Edgar—is taken down, the London County Council intend to set back the new buildings to the same line as that of the new hotel. The same setting back is being done at the spot in Piccadilly where the Egyptian Hall once stood, Mr. Woodward again being the architect for the new buildings. The Piccadilly of the future will be a thoroughfare 80 feet wide all the way from Hyde Park Corner to its end at the Circus.

STEPNEY AND ROTHERHITHE TUNNEL.

The works at the tunnel beneath the Thames, for which Messrs. Price & Reeves are the contractors, have been described in the *Morning Post*. The writer says:—

The tunnel now being constructed is to pass under the river a mile and a quarter below the Tower Bridge. Beginning at the junction of Union Road and Lower Road, Rotherhithe, and ending at Commercial Road, near Stepney railway station, it will be nearly a mile and a third long. It should be understood, however, that the word "tunnel" is only used here for convenience. Of the length mentioned, more than a third of a mile is allotted to open approaches, partly at one end and partly at the other. Rather less than a quarter of a mile is to be "cut and cover" work; that is, mighty trenches dug from the surface and arched over. The remaining two-thirds of a mile and 74 yards is the length of the tunnel proper. If anyone says that the river is not so wide the answer is that the work will pass under it aslant, and that a portion of it runs into the land. Its line is from just above the upper entrance of the Surrey Commercial Docks to a point between Shadwell Fish Market and the lower gates of the London Docks. Those who have passed through Blackwall Tunnel know that much of its impressiveness is due to enamelled white bricks and countless electric lights, and the same combination is to be used in the new sub-Thames thoroughfare. Thirty feet is the outside diameter of the tunnel, and the material is to be massive iron plates and concrete, forming a cylinder. The internal diameter will be 27 feet, or 3 feet more than that of the Blackwall Tunnel. A width of 16 feet is given to the roadway, which will therefore be of the same measurement as that in the kindred work. It is enough for two lines of vehicles, and as the engineers were unable to find room for three they give the spare space to the footpaths. In the Blackwall Tunnel each of these is only 3 feet across, a width not enough for nervous pedestrians brushed by omnibuses or by carts with projecting loads, but anyone who walks from Rotherhithe to Stepney will be comforted by 4 feet 8 inches of footpath on either side of the tunnel. For ventilation and as means of entry and exit there are four vertical iron shafts, each 50 feet wide, and all, of course, on the land. Two are already in their places, while two are being sunk, a word that literally describes the operation, for the ground is dug away beneath them, and they then descend by their own weight. Staircases will enable foot passengers to mount from the bottom of the tunnel to the street, or *vice-versâ*.

About 550 men are at work on the whole plan, and of these 200 are engaged under the river, where 230 feet of the tunnel has been driven. Where the water is deepest only 8 feet of earth lies above the line of the tunnel—a fact which causes the County Council's resident engineer to watch the ships with special interest. He was not pleased the other morning when a large vessel was dragging its anchor over the works. "Are you alarmed?" he was asked. "Not alarmed," he replied, "but I don't think

that people should pull the bed of the river about." Mr. E. H. Tabor, who helped to direct the building of the great dam at Assouan, is the resident engineer referred to; but the ultimate responsibility rests with Mr. Maurice Fitzmaurice, chief engineer to the Council. The tunnel is being driven from the northern shore by means of the shield system, and compressed air is used to prevent the river drowning both work and workers. At high tide 21 lbs. and at low tide 13 lbs. to the square inch is added to the ordinary pressure of the air, which, as everybody knows, is 15 lbs. to the same area, and for this purpose engines capable of working up to 1,000 horse-power have been temporarily established. In their steel-clad pen beneath the stream the toilers have carried on operations with safety and comfort for nearly a year. There has not been a single accident among them, nor any illness, except the passing ailments to which men everywhere are liable. One reason of the latter good fortune is that the atmosphere they labour in is not cold, the thermometer registering almost constantly 75 degs., for the air is warmed by compression. Another reason is the absence of dampness. When the Blackwall Tunnel was being made it was impossible to keep water out entirely, the bed of the river being gravel; but the new tunnel is quite dry, for luckily the stratum overhead is clay.

"What would happen to a man who came suddenly out of the compressed air into the ordinary atmosphere?" was a question put to Mr. Tabor by the writer of this article. "It might kill him." "And yet you have had no accidents." "That is so." "How do you prevent your workmen from running the risk? You cannot always watch them." "We don't need. They cannot get out in less than three minutes, and they have to pass through the air locks, where the pressure is gradually reduced to that of the normal atmosphere." Below the clay forming the bed of the river at this point lies rock, which is removed by blasting. Only small charges are used, as big ones would be dangerous in so confined a space. As for the fumes they are got rid of more easily than from a room. A workman has only to open a pipe communicating with the open air—there are several in the tunnel—and the foul air rushes out with prodigious rapidity, because of the higher pressure in the tunnel. About 500 truck loads (each weighing nearly half a ton) of clay and rock are sent to the surface daily. They pass through the air locks, and when the doors of those chambers are opened the smoke and hissing that come forth make them seem the haunt of a dragon. What, however, looks like smoke is really mist caused by contact of compressed air and the ordinary atmosphere. It must not be supposed that the engineers began blindly to burrow under the river. They made a pilot tunnel first, and only after gathering satisfactory assurances from that operation did they start the big tunnel.

While operations proceed beneath the Thames they are also going on at both the land ends of the projected road. Something has been done at Stepney but more at Rotherhithe. In the latter region both the open approach and the "cut and cover" subway are nearly completed. This part of the enterprise crosses over the East London Railway, into which one can peer from part of the new works. The County Council's engineers have to guard the railway against flooding while their own particular task is in progress, a duty they fulfil by means of much asphalte, puddled clay and watchfulness. The construction of the tunnels has entailed the removal of many old buildings in both Stepney and Rotherhithe, and notably the widening and lengthening of Adam Street on the south side. It is no longer Adam Street but Brunel Road, the County Council having given the latter name in honour of the man who designed and constructed the once famous Thames Tunnel. As for disturbed tenants, they number 2,743, for whom the Council is providing more than enough fresh dwellings. It is estimated that the whole work will cost 2,000,000*l.*, half of which is for the tunnel itself and half for land, buildings and compensation.

REBUILDING OF BALTIMORE.

Too great praise cannot be given to the people of Baltimore, says the British Consul, for the energy they have shown in the rebuilding of the city after the great conflagration of February 7, 8 and 9, 1904. It was estimated that the loss of property on that occasion amounted to 25,000,000*l.*, and in the past twenty-two months the former buildings have been replaced to a great extent by some of a more substantial character, with a great improvement architecturally.

Advantage has been taken to widen and straighten the streets in the burnt portion of the city, but much has yet to be done in laying down the roadways, which are in some cases in bad condition. This will no doubt soon be done, as it is intended to spend about 1,000,000*l.* (5,000,000 dollars) for paving purposes. It is observed that most of the bank buildings and those of other financial institutions have not been replaced by the high structures they formerly had, but by buildings of from two to three storeys, as the experience of the fire proved that the latter were not so liable to destruction. Ferro-concrete, or concrete reinforced with steel, has entered largely into the erection of buildings in Baltimore, with, it seems, considerable satisfaction. The concrete used is usually composed of one part best quality Portland cement, two and one-half parts clean sharp sand and five parts three-quarter inch stone, either granite or trap rock. The walls of a building are made by packing the concrete in wooden boxes while the material is in a plastic state. In these boxes have been placed vertical and horizontal pieces of steel, and when the cement hardens the walls become very strong; the same general method is used in the construction of floors, ceilings, roofs, &c., and it is claimed that as the metal is perfectly embedded in the concrete it is absolutely protected from atmospheric action and against intense heat. An interesting test of its strength was made a few weeks ago in a building in course of construction. A weight of 25,400 lbs. was placed on 84 square feet of the second floor and on a slab of concrete 4½ inches thick, the slab being supported on a beam 6 inches by 8 inches. This weight was allowed to remain for twenty-four hours, and after it had been removed the beam only showed a deflection of one-eighth of an inch.

LIGHTING OF BRIGHTON CHURCHES.

THE engineer and manager of the Brighton Corporation's electric works has reported to the lighting committee respecting the supply of electricity to Brighton churches on the time-switch system. Many of the churches which changed their supply to this arrangement, he says, have not kept to the letter of their agreement, and on numerous occasions each year, at the worst times for us, on account of social or some other special meetings held in the church, they have asked for and been granted the privilege of using their full demand during restricted hours, and this has come to be abused to such an extent that it is really giving churches an unfair advantage over other consumers, which, owing to their large demand and short hours daily use, is not justified. The flat rate of 4*d.* per unit fairly meets the circumstances of their case, and is a reduction of at least 40 per cent. on what they previously paid under the maximum demand system. Those churches who now get their supply for less than 4*d.* on the time-switch use gas to a large extent in conjunction with their electric light. If they used electricity entirely at a flat rate of 4*d.* per unit for lighting and 1½*d.* per unit for power for blowing the organs, and made due allowance for the present cost of gas, they could then do all their lighting by electricity without seriously increasing their present lighting bills, and have the advantage of good ventilation and fresh air, with entire freedom from restriction as to demand or hours of use. The few churches which have entailed some outlay in altering their circuits should consider as a set-off the enormous saving (in most cases many times the cost of such outlay) which they effected during these years which they have enjoyed an exceptionally low tariff. It was a mistake to have included lighting under the time-switch system, which was primarily intended to encourage all day use of motors for industrial purposes, and considering the small amount of hardship which the abolition of the time-switch will cause to this class of consumer, I strongly advise that the resolution which has been passed by the Council be allowed to remain in force. If a concession to churches, it can reasonably be argued that it should be extended to all classes of consumers, and if it is granted it will ultimately lead to great loss in revenue from any profitable consumers who are quite satisfied with the price they pay under the maximum demand system of charging. Considering the high prices paid for coal in the south, 4*d.* for lighting and 1½*d.* for power without any restriction will compare most favourably with anything in the country, and if generally used at this rate by churches the average rate will probably come down to 3*d.*, which is considerably less than half they paid under the old conditions of charging some years ago.

It is recommended by the lighting committee, "That the

alternative flat rate charge for electricity supplied for lighting purposes be reduced from 4*d.* to 3*d.* per unit in the cases of supplies to churches and chapels."

MANCHESTER BY-LAWS.

IN the report of the Council of the Manchester Society of Architects is the following account of negotiations with the City Council :—

Your Council has followed up the communication made to the Manchester Corporation last year relating to the manner in which objections to plans lodged by architects are notified, and has received the following extract of the proceedings of the improvement and buildings committee dated March 8, 1905 :—

"The deputy town clerk, referring to the letter dated February 15, 1905, from the secretary of the Society of Architects (entered on the Minutes of this committee on February 22, 1905, page 181) respecting the mode of communication by the Corporation of the disapproval of plans, reported as fellows :—

"First.—With respect to plans and sections of new streets, it is provided in by-law 78 of the by-laws with respect to new streets and buildings, &c., in force in the city, that—

"Every person who shall intend to lay out a street shall deliver or send, or cause to be delivered or sent to the city surveyor at his office a plan and section of such intended street, and if the Corporation disapprove of the mode proposed in such plan and section of any part thereof, they shall, within one calendar month after receiving the same give notice in writing to such person of the particulars of such disapproval.

"Secondly.—With respect to plans, &c., of buildings, it is provided in the Manchester Corporation Waterworks and Improvement Act, sec. 38, as amended by the Manchester Order confirmed by the Local Government Board's Provisional Orders Confirmation (No. 16) Act, 1899, Art. IV. (1) and (2) as follows :—

"So far as any building affected by the by-laws for the time being in force within the city with regard to buildings may be concerned, it shall not be lawful for any person to erect, alter or reconstruct within the city any such building, either wholly or in part, or to add thereto, until such person shall have given to the Corporation written notice of his intention, accompanied by such plans, sections and particulars as may be prescribed by such by-laws; and if the Corporation disapprove of the mode proposed in such notice, sections, plans and particulars, or any part thereof, they shall, within one month after receiving the same, give notice in writing to such person of the particulars of such disapproval, and of the requirements of the Corporation in respect of the proposed work, and in case the Corporation shall not signify in writing their disapproval of the mode so proposed within one month after receiving the notice, sections, plans and particulars, such person may proceed according to the terms of such notice, sections, plans and particulars, so far as they shall be in accordance with the Acts of Parliament and by-laws for the time being in force within the city.

"The deputy town clerk pointed out that if the Corporation disapprove of the mode proposed in notices, plans, &c., submitted to them under the above-mentioned provisions, it is incumbent upon them to give notice of such disapproval to the person intending to lay out a new street or to build, and that such person was, in his opinion, the owner, and not merely his agent or architect. The practice of the Corporation was to give notice to the owner, and in addition (as an act of courtesy) to send a duplicate notice to the architects.

"Thirdly.—With respect to elevations. The Manchester Improvement Act, 1871, sec. 19, as amended by the Manchester Corporation Act, 1891, sec. 21, provides as follows :—

"All buildings which shall hereafter be erected or built, or the external walls of which shall be materially altered, in any street which may have been, either before or after the passing of this Act, made, widened or substantially improved by the Corporation, shall be erected and built or altered according to a plan for the outside front or elevation thereof approved of by the Council, and the owner or other person interested in such building shall, prior to such erection, building or material alteration, deposit a plan with the Corporation, and if the Corporation disapprove of such plan they shall, within twenty-one days after receiving the same, give notice to the person depositing the same of the

URALITE FOR SMOKE TROUGHS

Not Affected by Acid Fumes.

W. SHELLSHEAR, Esq., writes :— Engineer-in-Chief for Existing Lines.
Sydney : 10th June, 1905.

Sirs,—In reply to your communication of the 29th ult. regarding the result of trial made by this Department of "Uralite," I have to inform you that two samples of "Uralite" were placed in the Smoke Troughs at Hamilton Engine Shed, and after an exposure of six months to the fumes from engine funnels they were taken down for inspection, when the composition was found to be in as good condition as it was before being placed in the troughs.

Yours truly,
(Signed) W. SHELLSHEAR, Acting Engineer-in-Chief.

particulars of such disapproval, and of the requirements of the Corporation in respect thereto, and in case the Corporation shall not, within the time prescribed, signify in writing their disapproval of such plan, such person may proceed according to such plan, so far as the same is in accordance with the Acts of Parliament and by-laws for the time being in force within the city.

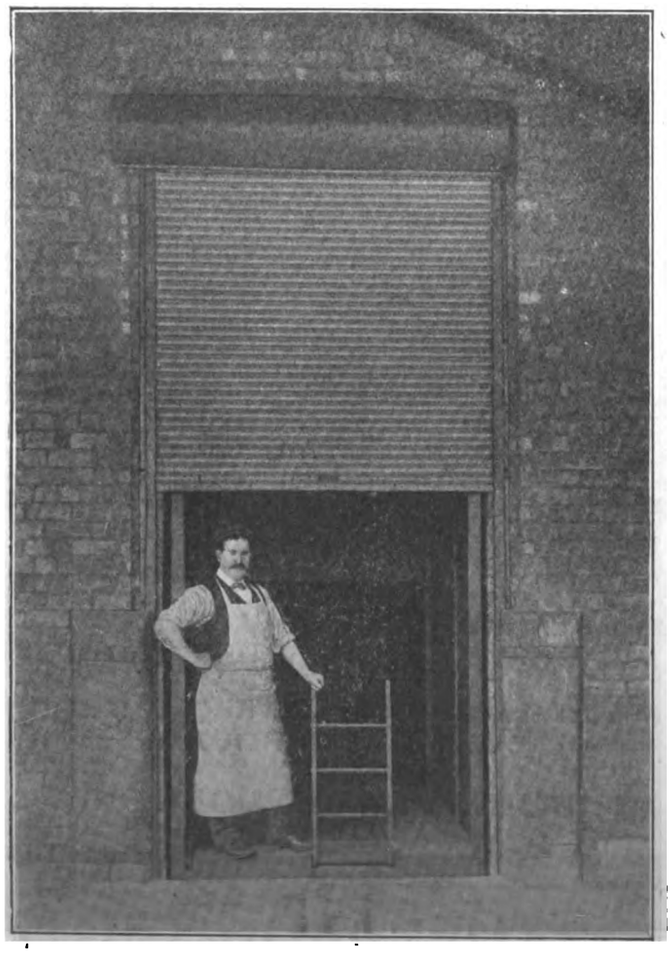
"The deputy town clerk pointed out that under the last-mentioned provision the Corporation may give notice of disapproval of a plan of an outside front or elevation of a building to the person depositing the plan; that the giving of such notice to an architect only is a compliance with the statute, and that was the present practice of the Corporation.

"The deputy town clerk recommended that the present practice with regard to the giving of notices should be adhered to.

"Resolved, 'That the above recommendation be approved and adopted, and that the town clerk be instructed to reply to the letter of the secretary of the Society of Architects above referred to.'"

Subsequently a deputation from the Council interviewed Mr. Thomas Hudson, the deputy town clerk, and discussed the whole matter very fully with him, and at his request embodied the views of the Society in a letter dated July 10, 1905, which, after stating that the architects of Manchester, as represented by this Society, considered that they were not fairly treated in connection with some of the notices sent out under the authority of the Council of the city, went on to give authentic instances in support of their contention and concluded by saying:—

"To prevent in future such injustice being done to the architects of this city we desire respectfully to ask the committee interested, and also the Council, to make the following rules absolute:—



"1. That when architects deposit drawings for passing by either the improvement committee or the paving committee, in the case of such drawings needing alteration to come within the by-laws, the architects and the architects only are communicated with to rectify and bring the said drawings within the by-laws. If the architects will not alter the drawings to suit the by-laws it shall be open then, and then only, for the proprietor to be notified by the Council of the disapproval of the plans, and the reasons to be given.

"2. That any notice from any committee, or under any section of any Act, which is sent to the proprietor of the said buildings contains only facts, and that no objection is stated to exist which does not exist.

"We think we are entitled to this protection and respectfully beg that it should be granted."

THAMES WATER.

The public analyst to the borough of Southwark, Dr. Scott Tebb, has compiled a report on the metropolitan water supply. The results of a series of analyses of water taken from the Thames within the areas of supply are given. Dr. Tebb says with respect to contamination:—"It cannot be too strongly insisted upon that we know nothing of the essential cause of either typhoid or cholera, that the medical profession is as much in the dark now as it was forty years ago; and to suppose as inferred by the Balfour Commission that a few thicknesses of sand and gravel in a filter will hold back these diseases is a very dangerous doctrine." Dr. Tebb claims as the result of his investigations to have shown:—"(1) That five out of the seven commissions or committees of inquiry which have investigated the quality of the Thames water have condemned the river as a source of domestic supply to the Metropolis. (2) That the quality of the water as indicated by the analyses has shown no substantial improvement during the last thirty years. (3) That the river and its tributaries are at the present time extensively polluted by sewage, sewage effluents, foul house refuse and other obnoxious matters. (4) That it is doubtful if this excessive pollution can ever be prevented, especially in times of flood, from gaining access to the river. (5) That there is no reason to suppose that the poison of cholera or typhoid can be eliminated from drinking water by any practicable process of purification such as filtration." He urges that London should as soon as possible abandon the Thames as a source of domestic supply. Other large towns, such as Liverpool, Glasgow, Manchester and Birmingham, have obtained their supplies from distant sources, and he considers it deplorable that London should still lag behind.

Architects, Contractors, and others are recommended to journey by the

GREAT CENTRAL RAILWAY.

They will find it

RAPID TRAVEL IN LUXURY.

Each Express is VESTIBULED and has a BUFFET CAR attached available for FIRST and THIRD-CLASS PASSENGERS.

The London Express Trains centre on Sheffield, branching therefrom westward to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool; northward to Huddersfield, Halifax, Bradford, Leeds and York; eastward to Doncaster, Grimsby, Hull and North Lincolnshire.

Cross Country Expresses and Through Arrangements with other Companies are a distinct feature of the Great Central services. Liverpool, Manchester, and Sheffield are linked up by corridor trains with Lincoln, Harwich, Lowestoft, Norwich, and the Great Eastern system.

Newcastle, Sunderland, Durham, York, Bradford, Huddersfield, Rotherham and Sheffield are provided with through trains *via* Nottingham, Leicester, Banbury and Oxford, to and from Southampton, Bournemouth and the South-Western Line.

Bath, Bristol, Exeter, Torquay, Kingswear, Plymouth, and the Cornish Riviera are reached by Express Trains from Leeds, Wakefield, Halifax, Huddersfield, Sheffield, Nottingham, and Leicester.

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. off ordinary fares.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

AN inquiry was recently held by Dr. Waldo into a fire which occurred in a London building over 200 years old. The coroner said on the ground floor was an electric motor, energy supplying it from a pipe which ran through the basement. There was an apparatus in the basement, but the switch controlling the motor was on the ground floor in close proximity to the motor on the wall, which was composed of wood. There was a great deal of matchboarding about. The cause of the present fire was reported as unknown, but, according to Dr. Waldo, there was a suspicion that the outbreak was due to a defective electrical circuit. In London seventy fires were attributed during the year to that cause, and ten others were doubtful. During the past two years twelve in each year had been attributed to that cause in the City. The jury returned the following verdict and rider:—"The premises were burned by a fire which originated in the ground-floor room, but the cause has not been determined by the evidence. The jury, however, are of opinion that the electric installation was defective, inasmuch as the main double pole switch was not placed sufficiently near the point of entry. The jury recommend that the regulations as to fixing the apparatus should be according to the Electrical Engineers' Institution recommendations."

Steel girders and floor plates:—Workington Bridge and Boiler Co. (accepted, amount included in tender of Johnston).

CITY OF LONDON DIRECTORY.

WE have several times noticed the annual volumes of the "City of London Directory," brought out by Messrs. W. H. Collingridge & Son, Ltd., who possess exceptional advantages for the preparation of works relating to London, whether in ancient or modern times. The latest issue of the Directory is, like its predecessors, well adapted for reference by the variety of the typography and other merits. It is accurate and essential for everyone who is eager to transact business within the limits of the City.

HIS MAJESTY'S Minister in Switzerland (Sir G. F. Bonham, Bart.) reports that the National Council have passed a resolution by a large majority which will doubtless as time goes on exercise a far-reaching effect on the financial and industrial situation in Switzerland. Hitherto the country has depended for fuel for manufacturing purposes on coal imported from Germany, France, or Belgium, but the new measure now passed will not only prevent the neighbouring States from deriving advantage from Swiss water power, but will doubtless lead to Switzerland developing the enormous resources of power stored up in its mountain streams and rivers, and rendering itself practically independent of fuel supplied from abroad. By the terms of the resolution the diversion of electric power derived from hydraulic pressure is made subject to the authorisation of the Federal Council under reservation of rights already granted by existing international treaties. The Federal Council grants permissions if the force is not employed in Switzerland, and if no Swiss interest is injuriously affected. Permissions cannot, however, be granted for a period exceeding twenty years, but they are renewable. A term of three years is fixed for the duration of this decree, subject, however, to renewal by the Federal Chambers, and it is to be enforced immediately on account of its urgent character. Sir G. Bonham says that it will, however, be necessary to provide an additional article for the Constitution confirming the action embodied in the resolution, and presumably further defining the policy which will be pursued with regard to this question.

VARIETIES.

AT Burslem County Court a youth was awarded 30*l.* under the Employers' Liability Act for the loss of his left hand while cleaning a die and stamp, against Messrs. Cornes & Sons, brickmakers, Stockton Brook.

THE tramways committee of Dudley Corporation recommend that application be made to the Board of Trade for sanction to borrow 90,000*l.* to cover the purchase money and costs, and also to lease all the tramways and light railways in the borough, and that the terms of such lease be considered by the sub-committee already appointed.

IN Dundee two different rate of wages are paid to painters, and a proposal is at present before the men to have the lower of these raised to the same level as the higher. The two grades are 8½*d.* and 8*d.* per hour, the former being paid to house and the latter to ship painters, and it is now suggested that the rate should be a uniform one of 8½*d.*

AT the meeting of the Notts County Council the highways committee reported that they had decided to use tarmac on sections of the more expensive roads, as the results of experiments made in the county in recent years go to show that roads made with this material not only bear heavy traffic, but are also less expensive in the matter of upkeep, and to a considerable extent the dust nuisance is got rid of.

THE new sewerage works at Penistone were opened on Tuesday. About four miles of sewers, with nearly 100 manholes, flushing tanks and storm overflows, have been constructed. The sewage disposal works have been designed to treat daily 120,000 gallons of sewage, or twice the daily dry weather flow from the district. The works are on the bacterial system. The automatic distributing apparatus was designed and manufactured by Messrs. Mather & Platt, Manchester. The cost of the works is about 9,200*l.* altogether. The engineers are Messrs. Spinks & Pilling, Leeds.

THE American cement industry in 1905 produced 40,894,308 bbl. of Portland, natural and slag grades, worth 36,012,189 dols., according to the United States Geological Survey. This was an increase of 9,219,051 bbl., valued at 9,980,269 dols., over the production of the previous year. Of the total amount 36,038,812 bbl. were Portland cement, with a value of 33,326,523; 4,473,049 bbl. were natural rock cement, valued at 2,413,052; and 382,447 bbl. were slag cement, valued at 272,614 dols.

THE promoters of the scheme for the construction of a tunnel under the Channel to connect England and France are taking special measures to give their proposals definite shape. New plans and specifications are in preparation, and the promoters hope to have these in readiness for deposit in the Private Bill office by next November, in the anticipation that opportunity may be found during the Parliamentary session of 1907 to introduce the necessary Bill.

THE Norwich Town Council have adopted a recommendation from the sewerage and irrigation committee that the detail plans, estimates and specifications prepared by the city engineer for the erection of pumping plant at Trowse pumping station, and for a new rising main from Trowse to Whitlingham Hall Farm, and for the construction of tanks, filters and works for the treatment and distribution of sewage and other necessary contingent works in connection with the farm be approved; and that the town clerk be authorised to apply to the Local Government Board for sanction to borrow the estimated cost thereof, which amounts to 54,000*l.*

THE health committee of the Oldham Corporation have resolved to recommend the following scale in relation to black smoke for adoption by the Town Council:—"Where one or two boilers are in use the limit of black smoke allowed is two minutes in the half hour, for three boilers three minutes in the half hour, and for four or more boilers four minutes in the half hour." The larger mills are thus left with the same limit as at present—four minutes' black smoke in thirty—and the limit is reduced in the case of mills with three boilers or less.

THE city improvements committee of the Glasgow Corporation recommend the adoption of plans by the city engineer for four tenements, three storeys in height, proposed to be erected in Parkhead, on ground acquired at a cost of 425*l.* The probable cost of these tenements—the front walls of which are to be of stone and the back walls
